About VBrick Systems

Founded in 1997, VBrick Systems, an ISO 9001 certified vendor, is a privately held company that has enjoyed rapid growth by helping our customers successfully introduce mission critical video applications across their enterprise networks. Since our founding, VBrick has been setting the standard for quality, performance and innovation in the delivery of live and stored video over IP networks—LANs, WANs and the Internet. With thousands of video appliances installed world-wide, VBrick is the recognized leader in reliable, high-performance, easy-to-use networked video solutions.

VBrick is an active participant in the development of industry standards and continues to play an influential role in the Internet Streaming Media Alliance (ISMA), the MPEG Industry Forum, and Internet2. In 1998 VBrick invented and shipped the world's first MPEG Video Network Appliance designed to provide affordable DVD-quality video across the network. Since then, VBrick's video solutions have grown to include Video on Demand, Management, Security and Access Control, Scheduling, and Rich Media Integration. VBrick solutions are successfully supporting a broad variety of applications including distance learning and training, conferencing and remote office communications, security, process monitoring, traffic monitoring, business and news feeds to the desktop, webcasting, corporate communications, collaboration, command and control, and telemedicine. VBrick serves customers in education, government, healthcare, and financial services markets among others.

MPEG-2 Admin Guide

This **VBrick MPEG-2 Admin Guide** is written for anyone who will be using or configuring a VB6000 Series MPEG-2 VBrick appliance. This includes system administrators, network technicians, and anyone who will be using or configuring a VBrick network video appliance. VBrick encoder and decoder appliances are available in industry standard MPEG-2, MPEG-4, and other formats. MPEG-2 appliances are used for delivering low delay, DVD quality video over high bandwidth networks. MPEG-4 appliances are used for delivering low delay television quality video over low and medium bandwidth networks. These products are available in one and two channel configurations, as well as a combination encoder/decoder that delivers two-way interactive video (MPEG-2 and MPEG-4). An optional hard drive allows the video to be recorded at the source.

Organization

<u>Introduction</u>	Explains the basics. Provides general configuration recommendations as well as how to cable the appliance and connect it to the network.
<u>MPEG-2 Configuration</u>	Explains how to configure MPEG-2 video appliances using the IWS web interface.
<u>SDI Configuration</u>	Explains how to configure Serial Digital Interface video appliances using the IWS web interface.
<u>Status</u>	Explains all of the detailed status information available about the network, the encoder, the decoder, the hard drive, etc.
<u>Diagnostics</u>	Explains how to run a variety of onboard diagnostics including ping, traceroute, and decoder color bars.
<u>Maintenance</u>	Explains how to use various maintenance functions. These reading and saving all configuration parameters and changing user names and passwords.
<u>Maintenance Mode</u>	Explains maintenance mode and how it is used to recover if errors occur during of after a firmware download.
<u>VBStar</u>	Explains how to use this MPEG-2 appliance with a hard drive to record and pump high-quality video throughout your network.

Getting Help

If you need help, or more information about any topic, use the online help system. The online help is cross-referenced and searchable and can usually find the information in a few seconds. Use the tree controls in the left pane to open documents and the up and down arrows to page through them. Use the **Search** box to find specific information. Simply enter one or more words in the box and press Enter. The search results will return pages that have all of the words you entered—highlighted in yellow (Internet Explorer only). The **Search** box

is not case-sensitive and does not recognize articles (a, an, the), operators (+ and -), or quotation marks. You can narrow the search by *adding* words.

If you can't find the information you need from the online help, or from your certified VBrick reseller, you can contact VBrick [Support Services](#) on the web. Support Services can usually answer your technical questions in 24 business hours or less. Also note that our publications team is committed to accurate and reliable documentation and we appreciate your feedback. If you find errors or omissions in any of our documents, please send e-mail to documentation@vbrick.com and let us know. For more information about any VBrick products, all of our product documentation is available on the web. Go to www.vbrick.com/documentation to search or download VBrick product documentation.

Note VBrick has made every effort to ensure that the information in this document is accurate at the time of publication. However if we find are errors or omissions, VBrick reserves the right to make changes without notice. To see the latest documentation for this product go to www.vbrick.com/documentation

Font Conventions

Arial bold is used to describe dialog boxes and menu choices, for example: **Start > All Programs > VBrick**

Courier fixed-width font is used for scripts, code examples, or keyboard commands.

Courier bold fixed-width font is used for user input in scripts, code examples, or keyboard commands.

This bold black font is used to strongly emphasize important words or phrases.

Folder names and user examples in text are displayed in this sans serif font.

User input in text is displayed in this bold sans serif font.

Italics are used in text to emphasize specific words or phrases.

Introduction

Topics in this chapter

Overview	1
VBSSM	1
Mixed Model Appliances	2

Overview

Congratulations on your purchase of VBrick System's MPEG-2 video networking product. VBrick Systems provides high-quality video and audio encoders and decoders. VBrick also provides software decoding on any PC through StreamPlayer or StreamPlayer Plus software. The result is video that can be obtained from any source—whether a live camera feed, DVD or VCR—and sent over a network (or LAN). This video can then be decoded by a hardware appliance or Set Top Box and displayed on a television monitor, or it can be decoded through StreamPlayer Plus software and displayed on any PC connected to the same network. The VBrick appliance is based on a modular platform that allows a variety of models consisting of MPEG-2 and MPEG-4 compression algorithms along with optional network interfaces (such as SDI and hard drive for storage). This user guide is intended to cover all models and provide instructions on initial setup and advanced parameter configuration.

Note The VBrick appliance consists of different hardware versions, distinguished by the last digit of the part number -xxx0 or -xxx1/-xxx2 (see [Status: User Information > Main Board](#)). When the part number is -xxx1/-xxx2 there can also be differences based on the PLX EEPROM revision 1 or 2-and-higher (see Status: Encoder Status or Status: Decoder Status). Where differences occur, they are noted in the text.

VBSSM

VBrick Security and Surveillance Monitoring devices are video only—no audio. The VBSSM-MP2 (MPEG-2) and VBSSM-MP4 (MPEG-4) encoders are ideal for security and surveillance applications where full motion, high-quality video is required in a cost effective product. The VBSSM is a compact, rugged and reliable video network appliance that supports temperature ranges from -20 to 70°C. The VBSSM encoder accepts NTSC/PAL video, compresses it in realtime and transmits the video digitally over an IP network. The video is then displayed on TV monitors using numerous MPEG decoders, Set Top Boxes or on PCs through desktop decoder software such as VBrick's StreamPlayer. VBSSM devices provide the following features:

- Full motion, high resolution DVD quality video.
- IP Unicast or Multicast for streaming applications.
- Integral web server for configuration and management.
- Low delay encoding for end-to-end camera control - pan, tilt and zoom.
- Utilizes Layer III QoS – Diff Serv for prioritizing video over IP networks.

- Video encoding rates configurable from 8 Kbps to 15 Mbps.
- Transport and Elementary stream support.
- Optional – video camera with pan, tilt and zoom.
- Optional – 19 in. rack mount adapter (holds two across).

Table 1. VBSSM Models †

Model	Configuration	Description
9170-4200-000x	VBSSM-MP2	Ruggedized single channel MPEG-2 encoder.
9171-4200-000x	VBSSM-MP4	Ruggedized single channel MPEG-4 encoder with audio. Same enclosure as VBSSM-MP2.
9172-4400-000x	VBSSM-MP2/4	MPEG-2 or MPEG-4. This device has a different enclosure with a single video input that supports two channels. It also supports RS-422 passthrough. VBSSM-MP2 does not.
9174-4200-000x	VBSSM-MP4	No audio.
9175-4200-000x	VBSSM-MP4	With audio.

† See the *VBrick Appliance Getting Started Guide* for VBSSM rear panel drawings.

Mixed Model Appliances

In addition to dual devices (for example two encoders, or an MPEG-2 encoder and MPEG-2 decoder), VBrick supports mixed model appliances (for example a WM encoder and an MPEG-4 encoder). VBrick appliance v4.1 software supports almost any combination of VBrick devices in Slots 1 and 2 so you can mix and match as necessary. For example, you can have a WM encoder in Slot1 and an MPEG-4 encoder in Slot2, or you can have an MPEG-2 encoder in Slot1 and MPEG-4 decoder in Slot2. *The only exception is that you cannot have a WM encoder and an MPEG-4 decoder in the same appliance.* In general, encoders are installed in Slot1; decoders are installed in Slot2. WM encoders, if present, are always installed in Slot1.

Note VBrick WM, MPEG-2, and MPEG-4 appliances all run the same codebase. The configurable options and user interface vary according to the type of appliance (e.g. MPEG-2, MPEG-4, etc.) on which the code is installed.

Archiver and Recorder Functionality

Archiver/Recorder functionality may be different in mixed model appliances depending on how the slots are populated. In other words, the behavior of the device in a given slot may change depending on what combination of appliances are installed. See Figure 1 below and note the following distinctions:

- An *archiver* only records from an associated encoder. For example, a WM Archiver is associated with a specific WM encoder.
- A *recorder* is not associated with any encoder. It independently records one stream at a time from an encoder, a decoder, or from the network.
- On MPEG-4 appliances, there is no archiving *or* recording.

With this model, you can archive both slots at once.

With this model, you can only record from one slot at a time.

- In mixed models (with MP-2 and WM), the MP-2 recorder becomes an archiver and you can archive both slots at once.
- In mixed models (with MP-2 and MP-4), the recorder only supports MP-2 recording.

Figure 1. Archiver/Recorder Functionality

MPEG-2 Configuration

Configuration: Recorder	37
Configuration: FTP File Transfer	37
Configuration: Conferencing	37
Configuration: Passthrough	38
Configuration: System	42
Configuration: Video On Demand	50
Configuration: Script Management	51

MPEG-2 Overview

The basic VBrick MPEG-2 appliance consists of one or more of the following components. Note that the screens you see in IWS will vary depending on the model and how the appliance is configured.

1. A main controller card with the following:
 - 10/100Base-T Ethernet network interface.
 - Two slots for encoder and/or decoder boards.
2. Optional Interfaces:
 - MPEG-2 encoder.
 - SDI Serial Digital interface for encoders and decoders.
 - MPEG-4 encoder.
 - MPEG-4 decoder.
 - WM Encoder.
 - VBStar which includes a hard drive and FTP.

Note VBrick appliances have a number of optional hardware accessories, including the AudioMate microphone, Remote Control devices, and cameras. These work directly with VBrick appliances or through the use of ActiveX control software, also available from VBrick.

Table 2. IWS Configurable Options

Option	Applicable Model
Network	All VBrick models. <ul style="list-style-type: none">• Ethernet.
Billboard	Only on models which have decoders.
Decoder	Single or dual: <ul style="list-style-type: none">• Ethernet MPEG-2.• Ethernet MPEG-4.• SDI MPEG-2 (see SDI Configuration).
Encoder	Single or dual: <ul style="list-style-type: none">• Ethernet MPEG-2.• SDI MPEG-2 (see SDI Configuration).
Pump	VBrickStar models only (see VBrickStar).
Recorder	VBrickStar models only (see VBrickStar).
FTP File Transfer	VBrickStar models only (see VBrickStar).
Conferencing	Encoder and decoder combination models only.
Passthrough	All VBrick models.
System	All VBrick models.
Video on Demand	Decoder models only.
Script Management	All VBrick models.

Optimizing MPEG-2 Performance

VBrick appliances are designed to accommodate a variety of configurations. Options such as Hard Disk record and playback, and FTP file serving capability are fully meshed together, supporting a diverse set of applications. VBrick unit's configuration choices enable the widest range of features and capabilities and are designed to provide the user with a high degree of flexibility. In some extreme cases, users can create configurations that exceed the normal processing capacity of the unit causing it to not perform optimally. VBrick units provide statistical counters and status variables indicating current device utilization and can even be configured to report SNMP trap alarm conditions when these situations occur. Corrective action usually involves the reduction of a video rate or disabling a channel, easily performed via the IWS or CLI user interface. Under abnormal operating conditions, VBrick units provide total system protection against any integral damage and guarantee management connectivity via IWS or CLI.

In general, MPEG-2 video quality improves when video rate is increased. Significant video quality improvements are noticeable when moving between 1.2 and 5 megabits per second video rates. The video quality improvement becomes less noticeable when moving from medium rates to higher video rates (from 5–9 Mbps.) with most of the improvement occurring only during high motion video scenes. In essence, video quality is very subjective and relates to other components such as the response of the human eye, the quality and original content and signal, and the quality of the decoder and monitor. As a general rule, use the lowest video rate that best suits the application.

The following information represents guidelines for product configuration limitations, with regard to specific unit types. When configuring VBrick units, close attention must be paid to the total transport rate of all sources both entering and exiting the unit. In most cases the sum of all entering and exiting MPEG-2 data traffic should be closely monitored and kept to a minimum whenever possible. Once a configuration is decided upon and applied to the unit, the user can check the status of processor and device load via the IWS or CLI. The CPU utilization and overloaded status variables are an excellent indication on the overall unit's health. If the CPU utilization is high or the overloaded condition is occurring, the user may simply reduce video transport rates and re-run the test. As a part of regular maintenance, users should periodically check the CPU utilization, overloaded and buffer full count status variables to ensure the unit remains within its operating limits.

MPEG-2 Configuration Recommendations

- Maintain video rates at optimum levels. High rates do improve quality. VBrick recommends rates that use the lowest possible rate which gives acceptable quality. For MPEG-2, rates between 5–7 mbps exhibit excellent video quality.
- Avoid setting the transport rate manually. Use the automatic transport rate calculation mode (default operation).
- The maximum MPEG-2 transport rate of 17 megabits per second should be used judiciously.
- When using the hard drive, especially for recording, keep other device functions to a minimum to avoid discontinuities in the recorded content.
- Recording high video rate streams consumes hard drive space and limits the recording duration significantly. Additionally, high video rate streams require faster hard drive access times and are more prone to video dropouts.
- Periodic re-formatting of the hard drive will improve overall disk performance by reducing disk fragmentation, much like a computer behaves.
- Hard drive pump and record functions are designed to be mutually exclusive. When operating at medium to low rates it may be possible for the hard drive to pump and record simultaneously but it is not recommended.
- Encoding from and sending to multiple destinations consumes additional system resources. Furthermore, a 4300 VBrick unit with dual encoders is capable of sending 4 streams but will not be able to sustain operation at the highest transport rates.
- Increasing the IP video packet size improves overall performance both in Ethernet Mode. Please check with your network administrator first before deciding on what size is best for your network.

Absolute Maximum Transport Rates

This table provides the absolute maximum transport rates for given configurations.

Table 3. Maximum Transport Rate by Configuration

Model	Dest1, Dest2 Slot #1	Decoder Slot#2	Recorder	FTP Active	Player / Pump
6200	17,0	17	0	No	0
6200	15,15	15	0	No	0
6200	13,0	13	13	No	0

Model	Dest1, Dest2 Slot #1	Decoder Slot#2	Recorder	FTP Active	Player / Pump
6200	12,0	12	12	Yes	0
6200	11,0	11	0	No	11
6200	9,0	9	0	Yes	9
6200	11,11	11	11	No	0
6200	10,10	10	0	No	10
4300	17,0	17,0	0	No	0
4300	11,11	11,11	0	No	0
4300	13,0	13,0	13	No	0
4300	11,0	11,0	0	No	11
4300	9,9	9,9	9	No	0
4300	8,8	8,8	0	No	8
5300	17	17	0	No	0
5300	13	13	13	No	0
5300	14	14	0	No	14

Note All values are shown in Mbps. A rate of 0 indicates "off" condition. Configurations other than the above may operate at higher rates than indicated. IWS operation may become sluggish due to its lower system priority.

Configuration: Network

Configuration: Network > Ethernet

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "Configuration: Network" and the sub-section is "Ethernet Routing Management IPv6". The "Network DHCP" section is currently selected, showing radio buttons for "Disabled" (selected) and "Enabled". Below this are input fields for "DHCP Retry Delay (Minutes)" (15), "IP Address" (172.22.123.103), "Subnet Mask" (255.255.0.0), "Gateway IP Address" (172.22.1.5), "VBrick Host Name" (CD-M2-103HD), "Network Interface Speed" (Automatic), "Network Interface Type" (Automatic), and "Maximum Transmission Unit Size" (1024). Below these are sections for "Domain Name Server" (Primary: 172.16.1.100, Secondary: 172.16.1.101, Extension: com) and "Network Time Synchronization" (Primary: 172.16.1.100, Secondary: 172.16.1.101). At the bottom are buttons for "APPLY", "REVERT", and "DEFAULTS". A left sidebar contains a "Configuration" menu with options like Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. "END EDIT" and "SAVE CONFIG" buttons are also present.

Network DHCP	Dynamic Host Configuration Protocol – (Enable, Disable). On Ethernet models, if DHCP is enabled, the VBrick gets its IP Address or Network Timer Server and Subnet Mask from the DHCP server. If the DHCP server supplies the Gateway Address or DNS server address, these parameters will replace the user entered Gateway and DNS Time Server settings. If DHCP is enabled and the VBrick cannot obtain an IP address from the server, the VBrick will start in limited run mode after two minutes, using its default IP Address of 172.17.5.5. After 15 minutes, it will automatically reset and again attempt to acquire an address. The LCD screen on the front of the VBrick will indicate a DHCP failed message. Note: The VBrick appliance requires a minimum DHCP lease length of 8 minutes to work, however it is recommended to extend the lease time to what is maximally available via the network to avoid disruptions.
DHCP Retry Delay	See above. Use to adjust the time before the appliance will reset and attempt to acquire an IP address. Range 3–15. Default = 15.
IP Address	IP Address of the VBrick.
Subnet Mask	Subnet mask for the VBrick address.

Gateway IP Address	Valid gateway IP Address for communicating across distinct network segments. A valid gateway IP address is essential even though the VBrick will operate without one in some cases. When no gateway is configured, the VBrick may be unable to communicate with off-net IP hosts, for example, a foreign host which is used for configuration management via IWS.
VBrick Host Name	The Host Name defaults to the Media Access Control (MAC) address, a hardware address that uniquely identifies each node of a network. The VBrick's Host Name acts to identify the VBrick to various network applications including DHCP, SNMP and VBrick application tools. Note: <i>The Host Name syntax can be a maximum of 18 characters, the first character must be a letter and the rest can be letters, numbers or hyphens.</i>
Network Interface Speed	<p>Note: The settings for Interface Speed and Interface Type are interdependent. They must both be set to Automatic or they must both be set manually. Manual settings should be used only in the rare case when the VBrick is attached to network equipment that does not support auto negotiation. The VBrick's capabilities may be limited when its Ethernet link is at 10 Mbps and/or Half Duplex. If auto negotiation fails, the VBrick defaults to 10Mbit, half duplex and attempts "parallel detection," an alternative way to sense speed. Status parameters are available on the network status screen to indicate the state of the link and the current configuration of the Ethernet hardware. In auto mode, they reflect the results of the negotiation and in manual mode they follow the configuration options.</p> <p>(10Mb, 100Mb, Automatic). This allows the Ethernet interface of the VBrick to be manually forced to 100 Mbps or 10 Mbps. The default setting is Automatic which enables auto negotiation in the VBrick so it will automatically match its speed setting to the speed of the switch or hub to which it is attached. Automatic is the default and recommended setting.</p>
Network Interface Type	Half-Duplex/Full-Duplex/Automatic. This allows the Ethernet interface of the VBrick to be manually forced to Full Duplex or Half Duplex. The default setting is "Automatic" which enables auto negotiation in the VBrick so it will automatically match its duplex setting to that of the switch or hub that it is attached. Automatic is the default and recommended setting. In order for the Network Auto Negotiate feature to work effectively, the Ethernet switch must also support auto negotiation. A manually configured switch will only allow the VBrick to discover the connection speed—not the mode (full or half duplex).

Maximum Transmission Unit Size	Range 1024–1500 (default = 1500). The MTU is used for all network traffic from the VBrick and defines the largest network packet size that will be transmitted. A higher MTU brings higher bandwidth efficiency and VBrick recommends using the default. However you may wish to reduce MTU size to meet the requirements of some networks with VPN or other security tunnels that cannot tolerate 1500-byte packets. Note that MPEG-2 video playback on Vista PCs may be suboptimal with small MTU sizes.
--------------------------------	--

Domain Name Server

Primary Server IP Address	This is the primary server used for DNS.
Secondary Server IP Address	This is the secondary server used for DNS.
Default Domain Extension	This is the domain name used for DNS. Note that you can use the default (blank) values for these items.

Network Time Synchronization

These fields are used to synchronize network time using the host name or IP address of a known server to provide a synchronized time for all appliances in the network. To enable **Network Time Synchronization** after these parameters are set, go to [Configuration: System > General](#) on page 42 and check the box.

Note To Network Administrators. DHCP Option 4 is used by the DHCP server to return SNTP server addresses. This option must be enabled in the DHCP server for these addresses to be returned to the VBrick. If the DHCP server configuration is unknown, it is recommended that the address(es) be manually entered since the DHCP server-supplied address will always override a manually-entered address.

Primary Server IP Address or Host Name	Primary host name (VBrick Host Name or DNS Host Name) or IP address of valid SNTP server providing time synchronization. A blank field indicates the server address will be acquired via the DHCP server only if the Network DHCP field above is checked.
Secondary Server IP Address or Host Name	Secondary host name (VBrick Host Name or DNS Host Name) or IP address of valid SNTP server providing time synchronization. A blank field indicates the server address will be acquired via the DHCP server only if the Network DHCP field above is checked.

Configuration: Network > Routing

The MPEG-2 Appliance requires no routing configuration for the vast majority of network uses. Use these settings only in those rare cases when your network requires advanced routing features in the appliance.

<p>Routing Method</p>	<p>This selects which routing method will be used: Changes made to the Routing Method will require a reset of the box.</p> <ul style="list-style-type: none"> • Static – Allows routes entered in the static routing table to be automatically applied to the internal routing tables, after a power-up. • RIP Version 1 – Configures the VBrick to listen to RIP announcements. Routes are dynamically added per RIP specification. • RIP Version 2 Broadcast – Configures the VBrick to listen to RIP version 2 announcements. In this mode, RIP will perform classless routing based upon subnet mask. • RIP Version 2 Multicast – Configures the VBrick to listen to RIP version 2 announcements that are sent in multicast mode. Both broadcast and multicast announcements are processed.
<p>Static Routing Table</p>	<p>This table provides for user defined routing entries.</p> <ul style="list-style-type: none"> • Destination Network – Enter the destination address to be manually routed. • Local Gateway IP – Enter the Gateway to be used, when the forwarding destination address is as specified. • Network Mask – Sets the network mask to be associated with the destination address. • Error – This read-only field is used to report field entry error related to the route.

Configuration: Network > Management

These parameters define information used in the SAPs emitted by the VBrick, which are received by the VBDirectory management tool (see the *VBDirectory User Guide*) and other VBrick applications such as the ETV Portal Server.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled 'Configuration: Network' and features a sidebar with a 'Configuration' menu containing options like Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main configuration area is for 'Ethernet Routing Management IPv6' and includes fields for Group Name (The Group), Unit Number (249), and a 'Management SAP' section with options for Transmit Enable (Disabled/Enabled), SAP Timeout (90), Retransmit Time (10), Time To Live (32), Type Of Service (0), IP Address (224.2.133.134), and Port (20000). At the bottom, there are buttons for END EDIT, SAVE CONFIG, APPLY, REVERT, and DEFAULTS.

Group Name	Optional. This parameter defines the Group Name. It is included in the Management SAPs used by VBDirectory. It is used for organizing VBricks into groups to simplify use of VBDirectory.
Unit Number	Optional. The appliance unit number (range 0–2147483647) is used to identify each VBrick in a group.
Management SAP	Used by VBDirectory or MCS to detect the unit for the purpose of remote management. The following parameters apply.
Transmit Enable	This parameter controls the transmission of the Management SAPs (Enable or Disable).
Retransmit Time	This parameter defines the Management SAP Retransmit Time.
Time to Live	The number of hops (between routers) for which a Management SAP is valid on the network.
Type of Service	The TOS (Type of Service) can be configured in the IP header to establish packet priority in the network.
IP Address	This parameter defines the Destination IP Address for Management SAPs.
Port	This parameter defines the Destination Port for Management SAPs.

Configuration: Network > IPv6

In the current implementation of IPv6, MPEG-2 encoded streams can be unicast over IPv6 to an IPv6-enabled version of VBrick StreamPlayer. In this version, you continue to manage and configure the appliance over IPv4.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled "Configuration: Network" and features a sub-section for "Ethernet Routing Management IPv6". This section contains a checkbox for "IPv6 Auto Config Enable" which is checked and labeled "Enabled". Below this are input fields for "IP Address" and "Gateway IP Address". At the bottom of the configuration area are three buttons: "APPLY", "REVERT", and "DEFAULTS". On the left side, there is a "Configuration" menu with various options like Network, Billboard, Decoder, Encoder, Pump, Recorder, etc. At the bottom left, there are "END EDIT" and "SAVE CONFIG" buttons.

IPv6 Auto Config Enable	Enable IPv6. When enabled, the IPv6 parameters for IP Address and Gateway IP Address are automatically set. This is the recommended method.
IP Address	IPv6 IP address of the VBrick.
Gateway IP Address	Valid gateway IPv6 IP address for communicating across distinct network segments. A valid gateway IP address is essential even though the VBrick will operate without one in some cases. When no gateway is configured, the VBrick may be unable to communicate with off-net IP hosts, for example, a foreign host which is used for configuration management via IWS.

Configuration: Billboard

The Billboard feature allows you to display text and/or graphics on a TV monitor. The displayed billboard can span multiple pages with each page displayed for a specified period of time. Some uses of the billboard feature are to announce a daily calendar of events, directions to a particular conference room or even a slide presentation in conjunction with displayed video. VBrick models 62xx, 52xx and 53xx have a built in mini-browsers that support viewing limited HTML pages. The pages can either be kept inside the VBrick as part of the file system, or can be located on a remote HTTP server. Each page of the billboard is built using an HTML page with text and graphics created using the HTML tags supported. If billboard is to be supported on a remote server, the appliance requires read access to the HTTP server and may need to be configured. The following URL example shows the default page pre-configured by VBrick.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "INTEGRATED WEB SERVER Administration/Configuration". The navigation menu includes CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The left sidebar shows a "Configuration" menu with options: Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main content area is titled "Configuration: Billboard" and shows the following settings for Slot2:

Billboard	Slot2
Billboard	<input type="radio"/> Off <input type="radio"/> On
IR	<input checked="" type="checkbox"/> Enabled
URL	<input type="text" value="file:///BB01/VB_1.HTM"/>

At the bottom of the configuration area are three buttons: APPLY, REVERT, and DEFAULTS. Below the configuration area are two buttons: END EDIT and SAVE CONFIG.

On/Off	Turn Billboard on or off.
IR	Enable the IR remote control. If enabled you can turn the Billboard on or off using the remote.
URL	The local or external URL of the Billboard page.

Using the Billboard

Billboard may be invoked in several ways. Either use the PC browser to communicate with the VBrick Integrated Web Server (see separate section) to apply the billboard and turn it on and off, or press the Billboard key on the optional remote control to toggle it on and off. Use of the remote can be enabled or disabled through the configuration. Using IWS (or the VBrick SDK) an administrator can turn on a particular billboard remotely, and prevent anyone else from using a remote to toggle it on/off. If you have a dual decoder system, the remote has keys to select between two decoders.

By turning the billboard on/off, the saved URL is invoked and the browser will attempt to display the resulting page. The URL can be configured to be a local file with the prefix 'file:/' or point to remote server with the prefix http://. The default billboard is assumed to be a file located within the VBrick file system, file:///BB01/VB_1.HTM. If the billboard URL points to a file within the VBrick, the filename has to follow the DOS 8.3 filename convention (i.e. limited file name length). The valid extensions supported by the billboard are .HTM, .JPG, .GIF, and .BMP. It is common for the billboard pages to have an .HTM extension. Remote URLs are restricted to 255 characters.

Billboard FTP

It is possible to use FTP (File Transfer Protocol) to modify the contents of one of the pre-configured Bulletin Board files resident on the VBrick. Use the browser to FTP files, or any of the many FTP applications. Enter in the browser window:

FTP://xxx.xxx.xxx.xxx (where x is the IP address of the VBrick appliance).

Use the Username and Password (default is case sensitive admin, admin) to login to the VBrick. BB01 through BB16 are directories established to receive Billboard content. It is possible to cut and paste new contents to a Billboard location from a file located anywhere on the network or on the computer. To view the contents on the VBrick, change the URL in the Billboard Section of the Integrated Web Server. In this example, the URL for the new file in IWS Configuration: Billboard would read: `file:///BB03/atm.gif`.

Billboard URLs

A URL for the billboard is much like a URL on the Internet. URLs can be local or remote, and typically point to the source of the billboard to be displayed.

Local URL

A local URL points to a file within the VBrick, which can be downloaded to the VBrick using a FTP utility program. All local URLs begin with: `file:///`. There are sixteen pre-configured directories to place custom billboards inside the VBrick. The billboard directories are named BB01 to BB16.

Example 1

A single page billboard is placed in BB01. It requires one image file. The billboard page is named VB_1.HTM. The URL, which is not case sensitive, to enter in the Billboard URL box is: `file:///BB01/VB_1.HTM`

Example 2

A multi-page billboard is placed in BB01. It requires four image files, one for each page. The billboard pages are named VB_1.HTM, VB_2.HTM, VB_3.HTM, and VB_4.HTM. Each file is connected to the next page within the html file using the legal syntax. The URL to enter in the Billboard URL box is: `file:///BB01/VB_1.HTM`

Remote URL

Example 1

A single page billboard on a remote server with IP Address 172.16.2.79. The name of the billboard file is VB_1.HTM. The resulting URL is therefore: `http://172.16.2.79/VB_1.HTM`

Example 2

A single page on a remote server called www.VBrick.com. The folder name is "billboards". The name of the billboard file is VB_1.HTM. The resulting URL is therefore:

`http://www.VBrick.com/billboards/VB_1.HTM`

Billboard File Types

The file types supported are html (.htm), JPEG (.jpg), GIF (.gif) and windows bitmap (.bmp). Progressive GIF and JPEG are not supported. For the mini-browser to display the images, the images have to be BMP, GIF, or JPG. Dynamically generated web pages are supported as long as the output is pure HTML and uses HTML tags that are part of the set as described below. The server side engine must generate the page. JavaScript and VBScript are not yet supported. Functions that require these features, like "mouseover", or "onclick" are not supported.

Creating a Billboard

A billboard that fits on one screen (640 x 480 resolution) can be created using the following HTML tags:

A	DIR	H3	IMG	PRE
AREA	DL	H4	INPUT	SCRIPT
B	DT	H5	LI	SELECT
BASE	EM	H6	MAP	SMALL
BIG	FONT	HR	MENU	STRONG
BLOCKQUOTE	FORM	HTML	META	STYLE
BODY	FRAME	TH	NOBR	TABLE
BR	FRAMESET	TITLE	NOFRAMES	TD
CAPTION	HEAD	TR	OL	TEXTAREA
CENTER	H1	U	OPTION	UL
DD	H2	I	P	

The billboard text generated by the browser is Times Roman. The Font sizes supported are `` to ``. Background color and images are also supported. The standard HTML 16 color palette can be referred to by name, and other colors will be matched to the nearest color of a standard 232-color template. When creating billboards, please test your billboard for effect on all types of monitors on which it is going to be presented. S-Video output and Composite output from the V-Brick are supported.

Video Input

S-Video output from the VBrick to S-Video Input on the television yields the best picture to the TV monitor. If you do have S-Video input into your television set, it is recommended you use the S-Video output from the VBrick to the television. Most televisions also support composite input. The overlay image as used in the billboard can sometimes have the effect of "flicker" if the font is too small and used on a regular television. This is a product of the output video signal and the television. On higher-grade monitors, the effect is significantly reduced.

Font Sizes

It is recommended that font size 5 be used on the billboard. The VBrick has two types of video output signals. If S-Video out is used, the picture is significantly better than the Composite out. Text and graphics tend to appear sharper and do not flicker in S-Video as much as they do in the composite out. If a flickering effect makes your font unreadable, make it larger. Making the font bold or `` will reduce the effect of the flicker.

- The drawing area for Billboard is about 600X400 pixels.
- With a font size of 7, 8 lines of text fit on the screen.
- With a font size of 6, 13 lines of text lines fit on the screen.
- With a font size of 5, 18 lines of text fit on the screen.

Transparent Background

A web page can be created with a transparent background. The video will show through and any text or images will appear on top of the video. A custom META tag is used to support this feature. In the `<HEAD>` portion of the HTML page, enter the following. The chosen background color will then be overwritten by the transparent color.

Configuration: Decoder

Configuration: Decoder > Video

The VBrick decoder is used to uncompress MPEG streams and display them on a TV or monitor.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. A left sidebar menu lists various configuration categories: Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main content area is titled "Configuration: Decoder" and features a "Video Audio Network Picture-In-Picture" section. Below this, the "Decoder Video Format" is set to NTSC (selected), with options for PAL and PALM. A section titled "MPEG2 Decoder Video -- Slot2" contains settings for Logo Display (On), No Data Mode (Blank), and Closed Caption (Enabled). The "Configure PID" field is set to 0 with the "Auto" checkbox checked, and the "Actual PID" is 33. At the bottom, there are buttons for "END EDIT", "SAVE CONFIG", "APPLY", "REVERT", and "DEFAULTS".

Decoder Video Format	The format can be configured to be NTSC (30fps), PAL (25fps) or PAL-M (30fps). PAL-M is a video format standard used in Brazil. The main difference between PAL and PAL M is a lower resolution (525 lines instead of 625) and a higher frame count (30 frames per second at 60Hz versus 25 frames per second at 50Hz). <i>Note: Changing and applying this parameter will cause the VBrick to reset.</i>
Logo Display	Lets you display the VBrick logo on the decoder output (monitor). VBrick provides a Logo Customization Utility (available on the website) if you want to create an individualized logo.
No Data Mode	This allows setting the screen for a decoder with no video input to having either the last screen appear either frozen or blank.
Closed Caption	This setting enables or disables closed captioning. Closed Captioning does not operate when the Picture in Picture feature is selected. It is necessary to disable PIP. In SIF mode only CC1 and CC2 are valid. CC3 and CC4 fields are not supported.

Configure PID	MPEG-2 transmits its data in packets of 188 bytes each. At the start of each packet is a packet package identifier (or PID) that identifies the data stream associated with that packet. Because the MPEG-2 data stream might contain multiple video programs, the decoder has to choose a particular video channel to play. The PID selection provides that feature. If the user selects the automatic option, the first video PID identified will be used to select the video channel.
Actual PID	Actual PID being played. This read-only parameter is of interest when the user selects automatic. A value of 8191 indicates the PID has not yet been established.

Configuration: Decoder > Audio

The audio selection provides for the control and configuration of the decoded audio stream.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "VBrick INTEGRATED WEB SERVER Administration/Configuration". The navigation menu includes CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The left sidebar shows a "Configuration" menu with options: Network, Billboard, Decoder, Encoder, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main content area is titled "Configuration: Decoder" and contains a sub-section "Video Audio Network Picture-In-Picture". Below this, the "MPEG2 Decoder Audio -- Slot2" settings are displayed:

- Output Mode: Dual To Stereo
- Output Level: Alternate
- Left Gain: 0 dB
- Right Gain: 0 dB
- Configure PID: 0 (with a checked "Auto" checkbox)
- Actual PID: 36

At the bottom of the configuration area, there are four buttons: END EDIT, SAVE CONFIG, APPLY, REVERT, and DEFAULTS.

Output Mode	<p>The audio output mode can be one of five possible setting as shown below. Stereo directs the incoming left audio channel to the left output, and the incoming right audio channel to the right output. Mix combines the left and right audio channels and directs the combined output to both the left and right audio channels. Left selects the input left audio channel and sends it to both the left and right output channels. Right selects the input right audio channel and sends it to both the left and right output channels. Mute suppresses audio output. The Dual to options are only operational on an input stream that was encoded in Dual audio mode; otherwise, the Output Mode is determined by the corresponding audio encoder setting.</p> <ul style="list-style-type: none"> • Dual to Stereo • Dual to Mix • Dual to Left • Dual to Right • Mute
-------------	--

Output Level	Hardware-dependent; not shown on all models. Changes the range of values for Left and Right Gain. Normal – 14 dB to -48 dB (+14 to -48 on some decoder models). Alternate – 8 dB to -54 dB (+14 to -48 on some decoder models).
Left Gain	Used to adjust volume. Default = 0.
Right Gain	Used to adjust volume. Default = 0.
Configure PID	MPEG-2 transmits its data in packets of 188 bytes each. At the start of each packet is a packet identifier (or PID) identifies the data stream associated with that packet. Because the MPEG-2 data stream might contain multiple audio programs, the decoder has to choose a particular audio channel to play. The PID selection provides that feature. If the user chooses the automatic PID option, the first audio PID detected will be used to select the audio channel.
Actual PID	Actual PID being played. This read-only parameter is of interest when the user selects automatic. A value of 8191 indicates the PID has not yet been established.

Configuration: Decoder > Network

These parameters are decoder level IP parameters that instruct the decoder which IP stream to decode on TV monitors.

Source-Specific Multicast

Source-specific multicast is enabled by IGMPv3 and provides a way to share a limited number of multicast addresses. *You must have an IGMPv3 network.* Source-specific multicast is designed for multicasting across networks and has no benefit when sharing multicast addresses on the same subnet (unless your router supports IGMPv3 snooping). Multicast addresses in the 232/8 (232.0.0.0 to 232.255.255.255) range are reserved for source-specific multicast.

Source-specific multicast lets your decoder associate a multicast address with a specific source encoder IP address. (Note that the source multicast encoders must be on a different network than the decoders.) Source-specific multicast is supported on MPEG-2 and MPEG-4 encoders. There are no *encoder* settings for source-specific multicast; there are *decoder* settings (see below **Receive Address Mode** and **Source IP Address**) for MPEG-2 decoders only.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. A left sidebar menu lists various configuration options under 'Configuration', with 'Decoder' selected. The main content area is titled 'Configuration: Decoder' and features a sub-section 'Video Audio Network Picture-In-Picture'. Below this, a 'Decoder Network -- Slot2 (MPEG-2)' section contains several configuration fields: 'Receive' (checked 'Enabled'), 'Receive Address Mode' (radio buttons for 'IP Address' and 'Host Name', with 'IP Address' selected), and 'Mode' (radio buttons for 'Program Name' and 'Multicast', with 'Multicast' selected). There are three buttons: 'APPLY', 'REVERT', and 'DEFAULTS'. Below these are input fields for 'Receive Host Name', 'Receive IP Address' (239.22.123.103), 'Receive Port' (2103), 'Source IP Address', 'Packet Ordering' (checkbox 'Enabled'), 'Jitter Queue' (checkbox 'Enabled'), 'SAP IR Program Guide' (checked 'Enabled'), 'SAP Timeout (sec.)' (90), 'SAP Category', 'SAP IP Address' (224.2.127.254), and 'SAP Port' (12000). At the bottom, there are three buttons: 'APPLY', 'REVERT', and 'DEFAULTS'.

Receive Enable	Controls whether the decoder receives the video from the network.
Receive Address Mode	Allows the user to specify how the receive address will be configured: <ul style="list-style-type: none"> • IP Address – If the address entered in Receive IP Address (see below) is 232/8, the decoder will issue a source-specific multicast join if you enter the IPv4 address of the encoder in the Source IP Address field. • Host Name – This mode is only used for receiving unicast from the encoder. The Source IP Address is not used. • Program Name – Select from the list of MPEG-2 program names being multicast on the network. The Source IP Address is displayed but is read-only. The decoder will automatically update the Source IP Address field with the source IP address of the encoder generated by the program SAP.
Available Programs	Use when Receive Address Mode is Program Name. Select from dropdown list of available programs. This automatically populates Receive IP Address and Source IP Address.
Receive Host Name	Use when Receive Address Mode is Host Name. Sets the source for video by using the Host Name. This parameter can be used only for a unicast source.

Receive IP Address	Use when Receive Address Mode is IP Address. In multicast mode, this parameter defines the IP address of the stream to be decoded and displayed. In unicast mode, this parameter is optional. If left blank, the decoder will accept all data received on the receive IP port. If set, decoder will communicate with any VBrick that has the encoder "unicast poll" option set, and instruct it not to transmit it's stream unless this VBrick has this receive IP Address.
Receive Port	The receive port designates what local IP/UDP port is assigned to listen for incoming video.
Source IP Address	Used for source-specific multicast if Receive Address Mode is IP Address (this is the source IP address of the multicasting encoder). It is automatically populated when Receive Address mode is Program Name.
Receive Mode	This read-only parameter informs the operator whether the selected receive IP Address is Unicast or Multicast.
Packet Ordering	The identification number in the IP header determines IP packet ordering. The packet ordering feature lets the VBrick re-order packet fragments as they arrive. If you disable packet ordering, the out-of-order packets are simply discarded. Packet ordering may increase latency and can add up to 100 ms of additional delay.
Jitter Queue	Delay jitter is defined as the variation of the delays with which packets traveling on a network connection reach their destination. During exceptionally long periods of delay, a large quantity of video packets will be buffered in the network. When the situation that caused the delay is resolved, the buffered frames will be burst, as a group, to the decoder. The handling of delay jitter is then a problem of having enough buffering in the decoder to handle a long delay, allowing the video to seem uninterrupted, and enough capacity in the buffer to handle the subsequent burst that follows once the delay has terminated. Typically, long delays in the network are associated with packet loss. No amount of buffer at the VBrick will correct packet loss. When first enabled, the jitter Q buffers 85ms of the video stream. Once the jitter Q has been filled, the jitter queue meters out the buffered video to the decoder at a rate equal to the rate of the video stream. The jitter queue is drawn down during times of packet drought, allowing the video to seem uninterrupted, but is large enough to handle the subsequent 85ms burst of packets that result once the drought is over. The impact of enabling the jitter queue is that a 85ms delay is imposed on the video stream.
SAP IR Program Guide	Enables or disables the ability of the operator to select the program guide feature from his IR remote control.
SAP Timeout	If SAP Timing method is fixed, this provides a configurable timeout for program guide selections, in seconds. If no SAP is received within the timeout period, the entry is removed from the table of available programs. If SAP Timeout is variable, the entries are removed from the program table as per RFC 2974 (Refer to Configuration: System > General).

SAP Category	<p>This string can contain one or more category keywords that will limit the video streams displayed by the Program and Conference Guides. Keywords should be separated by spaces. Note that characters are ASCII and can only be lowercase. The total of all keywords in the string is 36 characters including spaces. If the Decoder's category string contains both the keywords "Math" and "Science," only video streams whose encoders have one or more of these keywords assigned, or those that contain no keyword, will be available to this Decoder. The Encoder's Category is established on the Configuration: Encoder > SAP menu screen of IWS.</p> <p>Note also the wildcard character * is supported at the very end of keywords only. It is only valid if one or more additional characters of any type follow the last non-wildcard character. Note that * with spaces on both sides will display all streams. Having no category defined (default) displays all streams.</p>
SAP IP Address	The receive IP address used to populate the Program Guide. This is typically set to the Announce Program Guide SAP of the encoder.
SAP Port	The receive IP port used to populate the Program Guide. This is typically the port number of the encoder.

Configuration: Decoder > Picture-In-Picture

This menu allows the user to configure the Picture-In-Picture parameters on the decoder output. The Picture in Picture feature is only available for encoder/decoder VBrick appliances.

Picture in Picture	By checking the Box this will enable the Picture-In-Picture display.
PIP Location	Picture-In-Picture can be any of the following 5 locations: top left, top right, bottom left, bottom right and center.

PIP Horizontal Size	The Picture-In-Picture horizontal size can be changed to any of the following 4 sizes – full, half, quarter, thumbnail.
PIP Vertical Size	The Picture-In-Picture vertical size can be changed to any of the following 4 sizes: full, half, quarter, thumbnail.
Brightness	(0 – 15) The luminance is the information about the varying light intensity of an image, is best described as brightness. Default = 0.
Saturation	(0 – 15) The saturation is the spectral purity or intensity of a color. Default = 8.
Hue	(-16 to +15) The hue is the attribute by which a color may be identified within the visible spectrum. Hue refers to the spectral colors of red, orange, yellow, green blue and violet. Default is 0. Adding hue reduces the saturation. Note that the Picture in Picture display will override the display of Closed Caption text.

Configuration: Encoder

Configuration: Encoder > Transport

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "Configuration: Encoder". On the left, there is a navigation menu with options: Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The "Encoder" option is selected. The main content area is titled "Configuration: Encoder" and contains a sub-section "MPEG2 Encoder Transport -- Slot1". The configuration parameters are as follows:

- Transport Rate: 0 (with an "Auto" checkbox checked)
- Actual Transport Rate: 5730000
- Transport Content: Video + Audio (dropdown menu)
- Delay Mode: High Delay (dropdown menu)
- Audio PID: 36
- Video PID: 33
- PCR PID: 34
- Destination2 Stream Type: Transport (dropdown menu)

At the bottom of the configuration area, there are four buttons: "END EDIT", "SAVE CONFIG", "APPLY", "REVERT", and "DEFAULTS".

Transport Rate	This option allows selection of the actual transport rate for the MPEG-2 transport stream transmitted from this encoder. If Auto is selected, the VBrick will choose an appropriate conservative transport rate, which will allow any video interval to be clearly transmitted. <i>If you enter a rate that is less than the combined video, audio and over-head an error message will be displayed indicating that the rate selected is too low.</i>
Actual Transport Rate	This read-only parameter provides the actual transport stream rate. It is of particular interest when the automatic option is selected above. Even if a transport rate is explicitly selected, the actual transport rate will differ from the selected rate since only certain rates are supported.

Transport Content	If the model number ends in -xxx1/-xxx2, the user can choose the transport content to be Video + Audio, Video only or Audio only. If the model number ends in -xxx0, the option is not displayed and video and audio always comprises the transport content.
Delay Mode	If the model number ends in -xxx1/-xxx2, the delay mode can be set to Low, Medium or High Delay. If the model number ends in -xxx0, the delay mode can be set to Low or High Delay. In low and medium delay modes, the Reference Distance is forced to 1 (no B frames). Low delay reduces latency but may also reduce video stability, depending on video content. If minimum latency is not an issue in the application, high delay will maximize video stability. Default Delay Mode is set to High Delay.
Audio PID	MPEG-2 transmits its data in packets of 188 bytes each. At the start of each packet is a packet identifier (or PID) that identifies the data stream associated with that packet. It is possible that a non-VBrick decoder may only accept audio streams with a certain PID setting. If so, then this feature allows compatibility with these decoders.
Video PID	MPEG-2 transmits its data in packets of 188 bytes each. At the start of each packet is a packet identifier (or PID) that identifies the data stream associated with that packet. It is possible that a non-VBrick decoder may only accept video streams with a certain PID setting. If so, then this feature allows compatibility with these decoders.
PCR PID	MPEG-2 transmits its data in packets of 188 bytes each. At the start of each packet is a packet identifier (or PID) that identifies the data stream associated with that packet. It is possible that a non-VBrick decoder may only accept PCR (Program Clock Reference) streams with a certain PID setting. If so, then this feature allows compatibility with these decoders. Note that certain decoders may require the PCRs to be embedded in the video stream. If so, these decoders are not compatible with the VBrick encoder.
Destination 2 Stream Type	The user can configure the appliance to transmit an Elementary stream as a secondary stream. A video ES, or video elementary stream, consists of all the video data for a sequence, including the sequence header and all the subparts of a sequence. A Transport stream contains both video and audio.

Configuration: Encoder > Video

These parameters are used to configure the Encoder video settings. The encoder video and audio configurations change if the appliance has an SDI, Serial Digital Interface. Please refer to [SDI Configuration](#) on page 57 for more information.

DEFAULTS

Meta Data String

Video Format	The format can be configured to be NTSC (30fps), PAL (25fps) or PAL-M (30fps). (The PAL-M feature is supported on models ending in xxx1 or higher.) PAL-M is a video format standard used in Brazil. The main difference between PAL and PAL-M is a lower resolution (525 lines versus 625) and a higher frame count (30 frames per second at 60 Hz versus 25 frames per second at 50 Hz).
Video Aspect Ratio	Aspect ratio is the ratio of the width of the image to the height of the image. Standard TV images generally use an aspect ratio of 4:3; DVD players and some camera can produce 16:9. Set this value to match the video input source, either 4:3 or 16:9.
Video Input Type	The input can be changed to accept either S-Video or composite (BNC). Note: VBSSM models do not support S-Video.
Video Source	This enables the user to select the bandwidth for tracking the video input. <ul style="list-style-type: none"> Normal – Select for stable sources such as SDTV, DVD or camera. High Jitter – Select for unstable sources such as VCR or VTR.

Closed Caption Enable	<p>Disables or enables closed captioning. It is recommended that Closed Caption be disabled unless required by an application. Default = disabled. Does not apply to models ending in -xxx0.</p> <ul style="list-style-type: none"> • Disabled – Default. • Video CC Enabled – Reads the embedded video closed captioning text. • Inserted CC Enabled – Inserts the user defined text set in the Closed Caption Text field.
Closed Caption Type	<p>Sets the Closed Caption Type to either ATSC Compliant or Alternate Format. When set to ATSC compliant, the type conforms to ATSC specification a53. When set to the Alternate Format, the type conforms to a proprietary method. Does not apply to models ending in -xxx0.</p>
Inserted CC Update Rate	<p>Sets the rate with which the closed captioning field gets updated for the box (default is medium). Only works when Inserted CC is enabled. Does not apply to models ending in -xxx0.</p> <ul style="list-style-type: none"> • Slow – When set to slow, the inserted closed captioning field will be updated every 60 seconds. • Medium – When set to medium, the closed captioning field will update every 20 seconds. • Fast – When set to fast, the closed captioning field will update every 5 seconds.
Inserted CC Text	<p>Sets the text that is inserted into the closed captioning field of the encoded stream (default is "inserted string" \h \d \t \c). Only works when Inserted CC is enabled. Does not apply to models ending in -xxx0. Note: The maximum number of characters supported is 32 (including the Host Name, Date and Time). No double quotes "", less than <, or greater than > symbols are allowed as part of the configuration string. If the whole string does not display on the screen the default string can be organized to have the Host Name (/h) last. The special strings are:</p> <p>\h or \H - Host Name</p> <p>\d or \D - Current Date</p> <p>\t or \T - Current Time</p> <p>\c# or \C# - Set Color (where # = the number corresponding to color): 0 = White, 1 = Green, 2 = Blue, 3 = Cyan, 4 = Red, 5 = Yellow, 6 = Magenta.</p>
Inserted CC Row	<p>Sets the position on the screen where the text defined in the Closed Caption Text field will appear in the decoded video. Can be set from 1 through 15, where 1 indicates the top of the screen and 15 indicates the bottom of the screen (default is 15), when Inserted CC is enabled. Does not apply to models ending in -xxx0.</p>

Reference Distance	For models ending in -xxx1/-xxx2, enables a user to set the difference between consecutive reference frames within a group of pictures (GOP). The values available are 1–3 (default = 2). If the Encoder Transport Delay setting is low or medium, the value must be 1. Does not apply to models ending in -xxx0. If Reference Distance and Intrapicture Distance are both 1, the encoder will produce all I frames.
Intrapicture Distance	Enables the user to set the distance between consecutive I frames within a Group Of Pictures (GOP). The values available are 1–19 (default = 16). Does not apply to models ending in -xxx0. If Reference Distance and Intrapicture Distance are both 1, the encoder will produce all I frames.
Luminance	0 to 255. Default = 128. The luminance is the information about the varying light intensity of an image, which is best described as brightness.
Contrast	0 to 127. Default = 62. The contrast is the range of light-to-dark values of an image that are proportional to the voltage differences between the black and white levels of the signal.
Saturation	0 to 127. Default = 66. The saturation is the spectral purity or intensity of a color.
Hue	Range is -128 to 127. Default = 0. The hue is the attribute by which a color may be identified within the visible spectrum. Hue refers to the spectral colors of red, orange, yellow, green blue and violet. Adding hue reduces the saturation.
Resolution	For models ending in -xxx0, the video resolution can be adjusted to Full D1, 1/2 D1, or 2/3 D1. For models ending in other than -xxx0, the video resolution can be Full D1, 1/2 D1, 2/3 D1, 352x240 (SIF), or 352x288 (CIF). Note that D1 resolution is not recommended at video encode rates below 5 Mbps. In SIF mode only closed captioning CC1 and CC2 in the menu settings of the video display are valid (TV menu monitor settings) CC3 and CC4 fields are not supported. The actual resolutions for NTSC and PAL are listed below: NTSC D1 720x480 NTSC 1/2 D1 352x480 NTSC 2/3 D1 480x480 NTSC SIF 352x240 PAL D1 720x576 PAL 1/2 D1 352x576 PAL 2/3 D1 480x576 PAL CIF 352x288
Bit Rate	The encoder's bit rate can be adjusted from 1 Mbps to 10 Mbps for models ending in -xxx0. For models ending in other than -xxx0, the bit rate can be adjusted from 1–15 Mbps.

Video GOP Time	<p>The hours, minutes and seconds for the GOP time, the creation time of the MPEG video stream. Can be set to one of three selections:</p> <ul style="list-style-type: none"> Encoder Time (default) GMT Time Local Time <p>Note: Within the GOP header of the video stream is a Time Stamp, in hours, minutes and seconds. If the receiving application uses this time stamp, it is desirable to configure the encoder to insert a real time of day in either local or GMT time. If no application is using this data, the setting should be left at Encoder Time, which merely uses the time elapsed since the encoder hardware was last reset.</p>
Meta Data	<p>When Metadata is enabled a new field will appear on the screen allowing the operator to insert metadata strings into the video as User Data. The normal use of metadata is to allow accompanying synchronized URL references to displayed in rich media applications. The VBrick StreamPlayer has the capability of extracting the metadata references and presenting them to an appropriate application. Contact VBrick for details.</p>
Meta Data String	<p>Shown if Meta Data is enabled. Maximum 58 characters. Click Insert Now to insert the meta data string into the stream.</p>

Configuration: Encoder > Audio

Models ending in other than -xxx0 may contain different types of audio hardware. The difference can be identified by physical differences in the audio connectors or by the revision number identified in Status: Encoder/Decoder Status – PLX EEPROM Revision E. The model identified as PLX EEPROM Revision 1 has black plastic collars around the L/R audio jacks. The model identified as PLX EEPROM Revision 2 has metal screw-on collars. Where features differ between the models, the differences are noted. For example, certain VBSSM models do not support audio (see Table 1 [VBSSM Models](#) † for details).

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled "Configuration: Encoder" and features a sub-tabbed interface with "Transport Video Audio Destination1 Destination2 Announce(SAP)" selected. Under the "MPEG2 Encoder Audio -- Slot1" section, the following settings are visible:

- Audio Input: Audio Jack
- Audio Balance(-127~127): 0
- Audio Input Level: Normal
- Audio Gain(dB): 0 dB
- Audio Channels: Stereo
- L+R Bit Rate(bits/sec): 256000
- Sample Frequency: 48KHz

At the bottom of the configuration area, there are four buttons: END EDIT, APPLY, REVERT, and DEFAULTS. A separate SAVE CONFIG button is located below the main configuration area.

Audio Input	Input can be from an Audio Jack (1/8" mini-phonon jack) or from Microphone DIN (AudioMate microphone). The default setting is Audio Jack.
Audio Balance	-127 to 127. Sets audio balance between left and right channels. Zero is balanced. 127 sends audio to right channel only; -127 to left channel.
Audio Input Level	Hardware-dependent; not shown on all models. See Audio Gain field for more details. <ul style="list-style-type: none"> • Normal – 7 to –53 dB and mute. • Alternate – 12 to –48 dB and mute.
Audio Gain (dB)	This setting controls the audio level of the encoder. It is model dependent: <ul style="list-style-type: none"> • On models ending in –xxx0 the settings are from 3 to –60 dB and mute. The default setting is 0 dB. A setting of 3 is equivalent to full volume, -60 effectively mutes the encoder audio. • On models ending in –xxx1/–xxx2 the settings differ based on the Status: Encoder > PLX EEPROM Revision number: If the Encoder PLX EEPROM Revision is 1, the settings are from 3 to –48 dB and mute. The default setting is 0 dB. A setting of +3 is equivalent to full volume and -60 effectively mutes the encoder audio. If the EEPROM PLX EEPROM Revision is 2 or higher and the Audio Input Level is set to Normal, the settings are from 7 to –53 dB and mute. The default setting is 0 dB. A setting of 7 is equivalent to full volume, -53 effectively mutes the encoder audio. If the Audio Input Level is set to Alternate, the settings are from 12 to –48 and mute. The default setting is 0 dB. A setting of 12 is the equivalent of full volume, -48 effectively mutes the encoder.
L+R Bit Rate	The transmission rate of the audio stream. If the model ends in -xxx0, the transmission rate can be 192, 256 and 384 Kbps **If the model ends in -xxx1/-xxx2 the audio bit rate can be 256 or 384 Kbps.
Sample Frequency	Frequency at which the audio is sampled at the encoder. If the model number ends in -xxx0, the sampling rate can be 44.1 KHz or 48 KHz. If the model number ends in -xxx1/-xxx2 the sampling frequency is 48 KHz.

Audio Channels	<p>Model dependent. (If the EEPROM Revision is 2 or higher, changing the Audio Channel setting affects the Sample Frequency.)</p> <ul style="list-style-type: none"> • If the model number ends in -xxx0, the parameter can be set to Stereo, Mono and Dual. The default setting is Stereo. • If the model number ends in -xxx1/-xxx2, the settings are dependent on the PLX EEPROM revision Number: • If the EEPROM Revision is 1, this parameter can be set to Stereo and Mute. The default setting is Stereo. • If the EEPROM Revision is 2 or higher, the parameter can be set to Stereo, Mono (left to stereo) or Mute. Default = Stereo. <p>Stereo – Stereo directs the input left channel to the left channel in the audio stream and the input right channel to the right channel in the audio stream.</p> <p>Mono (left to stereo) – Mono directs the left input channel to both the left and right channel.</p> <p>Mono (left only) – This option allows only the left input channel to be carried in the stream. Output is to the left channel only.</p>
----------------	--

Configuration: Encoder > Destination 1/Destination2

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The left sidebar lists various configuration categories, with 'Encoder' selected. The main content area is titled 'Configuration: Encoder' and shows the 'MPEG2 Encoder Destination1 -- Slot1' configuration page. The 'Transport' tab is active, showing options for 'Destination1', 'Destination2', and 'Announce(SAP)'. The 'Transmit' checkbox is checked and labeled 'Enabled'. The 'Destination Address Mode' is set to 'IP Address' (radio button selected) with an 'APPLY' button next to it. Below this, several fields are visible: 'Destination Host Name', 'Destination IPv4 Address' (239.22.123.249) with a 'Loopback' checkbox, 'Destination Port' (2249), 'Transmit Mode' (Multicast), 'Time To Live(#hops)' (63), 'Type Of Service' (0), 'Packet Payload Size' (4136), 'Unicast Poll' (checked, On), 'Unicast Ping' (checked, Enabled), and 'Join Own Multicast' (checked, Enabled). At the bottom, there are three buttons: 'APPLY', 'REVERT', and 'DEFAULTS'.

Transmit Enable	Controls whether the primary encoder output is to be transmitted to the network.
-----------------	--

Destination Address Mode	<p>Allows the user to specify how the destination address will be configured: IP Address, Host Name, or IPv6.</p> <ul style="list-style-type: none"> • IP Address – This is the Destination IP Address of the encoded video. When this is a multicast address, the transmit mode is also set to multicast. Similarly, if this is a unicast address, the transmit mode is also set to unicast. • Host Name – Sets the source for video to be received using Host Name of the source. It can be used only for a unicast source. • IPv6 – Use Internet Protocol Version 6. Note that IPv6 supports unicast transmissions only.
Destination Host Name	This is the destination Host Name of the network device that will be receiving the encoded video.
Destination IPv4/IPv6 Address	This is the destination IPv4 or IPv6 address (depending on what is selected above) of the network device that will be receiving the encoded video. (You can enter a source-specific multicast address (232/8) but it will have no effect unless the network is IGMPv3 capable. See Source-Specific Multicast on page 20 for details.)
Destination Port	This is the destination IP port of the network device that will be receiving the encoded video.
Transmit Mode	This read-only parameter (derived from the Destination IP Address) tells you whether the encoder is transmitting the video stream in Unicast or Multicast mode. In Unicast mode, if the network portion of the IP address is outside the scope of the local area network, the Unicast address is presumed to be outside the network.
Time to Live	The number of hops (between routers) for which an IP packet is valid on the network.
Type of Service	The TOS (Type of Service) can be configured in the IP header to establish packet priority in the network.

Packet Payload Size	<p>Controls the amount of MPEG data within each UDP packet. The default value is 4136. Since Ethernet networks are limited to a packet size of 1500 bytes, multiple IP packets are required to span one UDP packet. When choosing a packet payload size, special attention must be paid to the network capability and topology. The allowed range is 1316 to 8872 bytes per packet, even numbers only. When the MTU is set to the default of 1500, the VBrick appliance will not produce fragmented UDP packets at or below a payload size of 1472. Note that MPEG-2 video playback on Vista PCs may be suboptimal with small packet payload settings.</p> <p>If you wish to select something other than the default (4136), VBrick recommends that the Packet Payload Size be a number in the vicinity of the Actual Transport Rate divided by 800—but no smaller than 1316 and no larger than 8872. This recommendation represents a compromise: smaller payloads provide smoother delivery to the decoder and improve the decoder performance; larger payloads impose less demand on the encoder processing capabilities. This recommendation becomes increasingly significant as the transport bitrate decreases and falls below 3.3 Mbps; 4136 is a better value for Packet Payload Size when the transport bitrate is 3.3 Mbps or higher. It is also beneficial but not necessary for the Packet Payload Size to be a multiple of 188.</p> <p>Note that when you adjust the Packet Payload Size and video Bit Rate on the encoder, the decoder video may be affected. For example, when the Packet Payload Size on the encoder is set to 7000 or above and Bit Rate on the Configuration: Encoder > Video page is set from 1–1.4 Mbps, the decoder receiving the video may go into a continual reset loop (every 10–60 seconds depending on the settings). To stop the resetting, set the Bit Rate to 1.5 Mbps or higher.</p>
Unicast Poll	<p>This parameter is used to instruct the VBrick to poll whether the unicast destination VBrick is configured to accept this stream. If the unicast destination VBrick is not configured to accept this stream, this VBrick will not send the stream. This feature is designed to eliminate unwanted unicast video traffic across the network.</p>
Unicast Ping	<p>Feature for primary destination can be enabled, disabled. If the VBrick is designated to transmit a transport stream to any destination (whether another VBrick or not) in unicast mode, this parameter is used to instruct the VBrick to ping the destination periodically to test connectivity before sending the stream. If Unicast Ping is not enabled, and the destination goes off-line, the unicast stream may be broadcast to all destinations causing flooding on the network. This scenario largely depends on network architecture and may or may not occur. This feature should only be disabled if the network has a particular requirement that makes it unworkable.</p>

Join Own Multicast

Some network equipment requires that a multicast source (such as a VBrick encoder) join its own multicast group. This feature is enabled by default and has no adverse affect on equipment that is fully multicast compliant.

Configuration: Encoder > Announce (SAP)

Contains parameters used to change the SAP (Session Announcement Protocol) advertisements. SAPs are advertisement packets that are transmitted by VBrick appliances to other VBrick appliances and VBrick applications such as the Portal Server and StreamPlayerPlus. They are used to identify streams present in the network.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "VBrick INTEGRATED WEB SERVER Administration/Configuration". The navigation bar includes "CONFIGURATION | STATUS | DIAGNOSTIC | MAINTENANCE | HELP | HOME | LOGOUT". The left sidebar shows a "Configuration" menu with options: Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main content area is titled "Configuration: Encoder" and contains a breadcrumb trail: "Transport Video Audio Destination1 Destination2 Announce(SAP)". Below this, there are two sections: "MPEG2 Announce Common Information -- Slot1" and "Announce Program Guide (SAP) for Destination 1 & 2 -- Slot1". The "MPEG2 Announce Common Information" section includes fields for Program Name (CD-MPEG2-249), Program Author (My Author), Program Copyright (My Copyright), Category, Session Information (VBrick Streaming Video), Information URL, Contact Email, Contact Phone, and Contact Name. The "Announce Program Guide" section includes a "Transmit" checkbox (checked), Retransmit Time(sec) (10), Time To Live (64), Type Of Service (0), IP Address (224.2.127.254), and Port (12000). At the bottom, there are three buttons: "APPLY", "REVERT", and "DEFAULTS".

Announce Common Information

Program Name	<p>The string providing the name of the stream associated with this SAP. This SAP text shows up in the Program Guide for other VBrick products. Default is \H Program x (where x is 1 or 2, for slot1 or slot2). Note: All of the Common Information fields support replacement characters. <i>The replacement text is only shown in the SAP message at the destination decoder.</i> The fields are replaced by the actual information as explained below.</p> <ul style="list-style-type: none"> • \H or \h – Host Name of VBrick appliance. When the default entry is used, the VBrick is identified by the default Host Name (set in IWS in the Network: Ethernet section), and will be identified as such on the network, see the StreamPlayer software example below. • \B or \b – If the unit is a VBStar, this is the Base Name of the file being pumped by the Hard Drive Pump. • \F or \f – If the unit is a VBStar, this is the control name of the File being pumped. The control name is a combination which consists of 25 characters from the directory name, 25 characters from the base name, 3 digits containing the file extension and the punctuation (53 total characters maximum). If the directory portion is not present, this is the base name of the file being pumped.
Program Author	A string in the SAP that can be used to identify the author. Default is "My Author."
Program Copyright	A string in the SAP that can be used to identify the copyright information. Default is "My Copyright."

Category	<p>An encoder can have a SAP Category string. This string consists of one or more keywords separated by spaces. Each category keyword represents a tag associated with the Encoder's video stream. Decoders can be configured to display in their Program and Guides only video streams tagged by specific category keywords or those containing no keyword. The string(s), used by the Decoder, is set on the Decoder/Network screen. Note: Characters are ASCII and are case sensitive. The total of all keywords in the string is 36 characters including spaces.</p> <p>You can also use this field to filter the live streams shown in the ETV Portal Server by source and client IP address by using the following string: <code>IPMask=xxx.xxx.xxx.xxx</code> where <code>xxx.xxx.xxx.xxx</code> represents a bit mask. (This string is simply another keyword you can use in addition to those described above.) The Portal Server will parse the bitmask and send the live stream only to clients with a masked IP address that matches the masked IP address of the source VBrick. For example, a stream with a category <code>IPMask=255.255.0.0</code> from a VBrick with an address of <code>172.22.6.67</code> will be available to a client with an IP address <code>172.22.3.4</code> but not to a client with an IP Address <code>172.16.3.4</code>. There is no admin interface to this feature on the Portal Server; you can use this filtering in addition to the standard authorization features provided by the Portal Server.</p>
Session Information	A string identifying VBrick SAP Session Information. See Program Name field for a description of replace characters (\h, \b or \f). Appears on Program Guide. Default is "VBrick Streaming Video".
Information URL	Informational text.
Contact Email	Informational text.
Contact Phone	Informational text.
Contact Name	Informational text.

SAP for Destination 1 and/or 2

Transmit	Enables or disables the transmission of the SAP.
Retransmit Time	If SAP Timing is fixed, this is the time (in seconds) between transmissions of SAPs (1 – 9999). If SAP Timing is variable, the actual retransmit time as per RFC 2974 is reported back. Please refer to Configuration: System > General.
Time to Live	The number of hops (between routers) for which an IP packet is valid on the network.
Type of Service	The TOS (Type of Service) can be configured in the IP header to establish SAP packet priority in the network.
SAP IP Address	The receive IP address used to populate the Program Guide. This is typically set to the Announce Program Guide SAP of the encoder.
SAP Port	The receive IP port used to populate the Program Guide. This is typically the port number of the encoder.

Note SAP information appears in the Program Guide field displayed in other VBrick products, such as StreamPlayer and StreamPlayer Plus.

Configuration: Pump

See [VBStar Pump](#) on page 100.

Configuration: Recorder

See [VBStar Record](#) on page 105.

Configuration: FTP File Transfer

See [VBStar FTP File Transfer](#) on page 111.

Configuration: Conferencing

Conferencing is a feature that allows a user to set up a two-way video conference using the IR Remote Control. This screen provides the configuration of the necessary parameters.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. A left sidebar menu lists various configuration categories, with 'Conferencing' selected. The main content area is titled 'Configuration: Conferencing' and contains the following settings:

- Conferencing Setup: Disabled Enabled
- Conferencing Accept: Automatic Manual
- Local Ringer: Disabled Enabled
- Conference End Display Mode: Picture-In-Picture Blank
- Local Ringer IR: Disabled Enabled
- Conferencing Name:
- SAP IP Address:
- SAP Port:
- SAP Retransmit Time:

At the bottom of the configuration area are three buttons: APPLY, REVERT, and DEFAULTS. Below the configuration area are two additional buttons: END EDIT and SAVE CONFIG.

Conferencing Setup	This option enables/disables the ability of a user to initiate a conference using an IR remote control unit. Disabled prevents this VBrick from appearing on the Conference Guide of other VBricks.
Conferencing Accept	If Manual , the called party on this VBrick must explicitly accept the call with the IR remote control. If automatic, the call will be accepted without any action on the part of the called party.
Local Ringer	Used to enable/disable the ringer.

Conference End Display Mode	Allows the choice of what is displayed when the conference ends. Display either Picture-in-Picture (with the local encoder view) or a Blank Screen.
Local Ringer IR	If Enabled, the ringer may be enabled or disabled via the IR remote by the user (operator) of this VBrick. If disabled, the local operator cannot change the state of the ringer. It will remain as set above in "local ringer".
Conferencing Name	Used to configure the name of the user (operator) of this VBrick. This is the name, which will appear on the conference guide screen used to set up the conference. The default entry is \h or \H, which identifies the unit by the Host Name of VBrick appliance.
SAP IP Address	The SAPs for Conference Call setup are sent to this destination IP Address.
SAP Port	The SAPs for Conference Call setup are sent to this destination IP/UDP port.
SAP Retransmit Time	Allows setting the SAP retransmit time.

Configuration: Passthrough

The TCP/IP network can serve as an intermediary between two VBricks and their serial ports or between a PC application sending IP packets and a VBrick's serial port. Passthrough can be configured using addresses on Ethernet. Passthrough on COM2 is only available on VBricks with a CPLD (programmable logic device) Version greater than 21. (To check the CPLD , go to **Status > System Information > CPLD Version**.) *If the IWS screens do not provide a COM1 or COM2 selection at the top of the Passthrough screen, the VBrick defaults to COM1.* This feature supports a wide range of serial applications. See "Serial Port Passthrough" in the *VBrick Appliance Getting Started Guide* for more about serial port passthrough. Note that RS-232/422/485 end-to-end control is initiated by enabling or disabling Passthrough. The Passthrough port for COM1 is 4439; the port for COM2 is 4414.

Note COM is dedicated to Passthrough. COM2 is a dual purpose interface. At the factory default it can be used as a serial connection to the VBrick Command Line Interface (CLI) tool for configuration purposes. When configured for Passthrough, the CLI feature is used for camera control.

Configuration: Passthrough > COM1

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled "Configuration: Passthrough" and features a sidebar menu with options like Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main configuration area includes a text input field for "COM1 COM2", a dropdown menu for "Passthrough State" set to "Disabled", and a label for "Operational State" set to "Disabled". At the bottom of the configuration area are three buttons: "APPLY", "REVERT", and "DEFAULTS". Below the configuration area are two buttons: "END EDIT" and "SAVE CONFIG".

Passthrough State	Used to enable/disable Passthrough. Three states are possible: <ul style="list-style-type: none"> • Disabled – The VBrick will neither initiate nor respond to Passthrough setup requests. • Responder – In this case the VBrick will accept a connection request (up to 64 connection requests) from another VBrick set as an Initiator or from a PC camera control application. • Initiator – In this case it will continuously attempt to automatically initiate a Passthrough connection to the remote destination.
Operational State	Describes the current status of a Passthrough connection, including error conditions, if any. Refer to the Network Status Section. This will display "Active" if in Passthrough mode.
COM Interface Type	Describes the COM interface connector. (RS422/485 options are displayed only if main board has a Part Number ending in xxx3. See Status: User Information > Main Board.) <ul style="list-style-type: none"> • RS232 – standard RS-232 serial port connector. • RS422/485 – RS-422/485 4-wire serial port connector. • RS422/485 (Terminated) – RS-422/485 terminated.

Passthrough State: Responder

VBrick INTEGRATED WEB SERVER Administration/Configuration

CONFIGURATION | STATUS | DIAGNOSTIC | MAINTENANCE | HELP | HOME | LOGOUT

Configuration:

- Passthrough**
- System
- Video On Demand
- Script Management

Configuration: Passthrough

COM1 COM2

Passthrough State: Responder **APPLY**

Baud Rate: 9600

Stop Bits: 1

Parity: None

RTS Control: Automatic

DTR Control: Automatic

Operational State: Ready

END EDIT **SAVE CONFIG** **APPLY** **REVERT** **DEFAULTS**

Baud Rate	Rate can be set to the following (Default = 9600): 110, 300, 600, 1200, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 57600, 115200.
Stop Bits	Number of stop bits for Passthrough port (1 or 2).
Parity	None, Even, Odd.
RTS Control	Force Off, Force On or Automatic. If automatic, the control will be on when Passthrough is active. DTR and RTS are available for COM2 only for those VBrick models whose last digit is 3 or higher. Under no conditions are RTS or DTR controls passed through end-to-end. All control handling is local.
DTR Control	Force Off, Force On or Automatic. If automatic, the control will be On when Passthrough is active. See note above.
Operational State	Describes the current status of a Passthrough connection, including error conditions, if any. Refer to the Network Status Section. This will display "Active" if in Passthrough mode.
COM Interface Type	Describes the COM interface connector. (RS422/485 options are displayed only if main board has a Part Number ending in xxx3. See Status: User Information > Main Board.) <ul style="list-style-type: none"> RS232 – standard RS-232 serial port connector. RS422/485 – RS-422/485 4-wire serial port connector. RS422/485 (Terminated) – RS-422/485 terminated.

Passthrough State: Initiator

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled "Configuration: Passthrough" and features a sidebar menu with options like Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The configuration fields include:

- COM1 COM2**: A text input field.
- Passthrough State**: A dropdown menu set to "Initiator" with an "APPLY" button.
- Destination**: A dropdown menu set to "Slot1 MetaData" with an "APPLY" button.
- Baud Rate**: A dropdown menu set to "9600".
- Stop Bits**: A dropdown menu set to "1".
- Parity**: A dropdown menu set to "None".
- RTS Control**: A dropdown menu set to "Automatic".
- DTR Control**: A dropdown menu set to "Automatic".
- Operational State**: A text input field set to "Ready".
- Idle Time out (mSec)**: A text input field set to "500".

 At the bottom, there are three buttons: "APPLY", "REVERT", and "DEFAULTS".

Destination

- Remote COM1 using Slot1 Video Endpoint. This means that all serial data originating at the COM1 port being configured is sent to the COM1 port of the VBrick identified as the Slot1 video source (if Slot1 is a decoder) or to the Slot1 video destination VBrick (if Slot1 is an encoder).
- Remote COM2 using Slot1 Video Endpoint. Slot1 Destination 1 only. Same as above except Initiator destination is COM2.
- Dedicated. When Passthrough State is set as Initiator and the Destination is Dedicated, the VBrick appliance (whose serial port is the destination of this COM port) can be configured and identified using either an IP address or a host name.
- Slot1 MetaData. If Meta Data is enabled on the Encoder > Video page, the appliance captures incoming data from the serial port and inserts it into the stream as metadata. In a typical application, a GPS receiver connected to a VBrick can insert ASCII strings representing map coordinates into a stream. This information is saved and sent as metadata with the video. This feature is disabled when the appliance is in Edit mode.

The data is inserted when it reaches the maximum number of characters (58 for MPEG-2) or when the Idle Timeout (see below) between characters is reached. This feature works for all passthrough port baud rates but can only accept continuous serial data at rates up to 9600 baud; at higher rates there must be some idle time between metadata strings.

- Slot2 MetaData. Same as above except the serial port data is inserted as metadata in the video stream from the Slot2 encoder.

Baud Rate	Rate of Passthrough port. Rate can be set to the following (Default = 9600): 110, 300, 600, 1200, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 57600, 115200.
Stop Bits	Number of stop bits for Passthrough port (1 or 2).
Parity	None, Even, Odd.
RTS Control	Force Off, Force On or Automatic. If automatic, the control will be on when Passthrough is active. DTR and RTS are not available for COM2. Under no conditions are RTS or DTR controls passed through end-to-end. All control handling is local. DTR and RTS are not available for COM2.
DTR Control	Force Off, Force On or Automatic. If automatic, the control will be On when Passthrough is active. Not available on COM2. See note above.
Operational State	Describes the current status of a Passthrough connection, including error conditions, if any. Refer to the Network Status Section. This will display Active if in Passthrough mode.
Idle Time out	5–2000 milliseconds. Default = 500. The interval between characters at which metadata is inserted into the stream.
COM Interface Type	Describes the COM interface connector. (RS422/485 options are displayed only if main board has a Part Number ending in xxx3. See Status: User Information > Main Board.) <ul style="list-style-type: none"> • RS232 – standard RS-232 serial port connector. • RS422/485 – RS-422/485 4-wire serial port connector. • RS422/485 (Terminated) – RS-422/485 terminated.

Dedicated Address Mode

When the Passthrough State is set as Initiator and the Destination is Dedicated, the VBrick appliance can be configured and identified using either an IP address or Host Name.

Configuration: Passthrough > COM2

Passthrough settings for COM2 are a subset of COM1. See [Configuration: Passthrough > COM1](#) for complete details. As noted, DTR and RTS are not available for COM2. Under no conditions are RTS or DTR controls passed through end-to-end. All control handling is local.

Configuration: System

This menu allows the user to set-system related parameters.

DEFAULTS

Network Time Synchronization	Enabled or Disabled. If enabled, the System Date Time field is inactive. See Network Time Synchronization on page 11 to set host name or IP address of time server. <i>You must set these parameters before you can enable Network Time Synchronization on this window.</i>
System Date Time	Set system date and time in mm/dd/yyyy hh:mm format.

System

Current Operational Mode	Indicates the current operational mode of the VBrick. The following modes are supported. Note: Changing the Operational Mode automatically reboots the VBrick.
Configured Operational Mode	Indicates the configured operational mode of the VBrick. The following modes are supported: <ul style="list-style-type: none"> • Run Mode – Normal operation. • Diagnostics – User selected mode for running certain VBrick diagnostics.
Time Zone	Select from list: (GMT-12) Eniwetok – (GMT +12) Auckland.

Daylight Savings Time	Enabled or Disabled.
Login Message	Enter up to 300 characters of alphanumeric text and special characters (except quotation marks) that will be displayed on the IWS login page.
IR Enable	Enable or Disable the IR remote control. This is the master enable and disable for the IR across all functions.
Fan Mode	This option allows a user to either force the fan always high or to automatically cycle on and off based on measured temperature. Default = Automatic. Note: This option is only available on VBrick models with a main board assembly whose last four digits are 0206 or higher.
SAP Timing Method	Fixed or Variable - If fixed, the SAP timing will operate as defined in the encoder, decoder and pump screens with fixed SAP transmission and timeouts. If variable is selected, the entire VBrick will use SAP timing as defined in RFC 2974. For most applications, Fixed Timing should be used.
RFC2974 Bandwidth	Allows setting the SAP bandwidth allocation in Bits per second. This setting is used only when the Timing Method is set to Variable.
Relay Control	This option allows forcing the relay connection to Open or Closed. Note: This option is only available on VBricks with a main board assembly whose last four digits are 0205 or higher.
Vision Protocol	Enables a subset of the Vision ADMAS control protocol. This protocol is not recommended for general use.

Front Panel LCD Display

These settings will be displayed for approximately 6 seconds. After 6 seconds the LCD will display the current release, IP address, hostname plus transmit and receive addresses.

Box IP Address	Enable or Disable the Box IP Address display on the Front Panel Display.
Destination IP Address	Enable or Disable the Destination IP Address display on the Front Panel Display.
Receive IP Address	Enable or Disable the Receive IP Address display on the Front Panel Display.
User String Enabled	Enable or Disable the text displayed on the front panel LCD of the VBrick appliance can be user defined.
Top Line User String	The top line can support up to 16 characters. (characters in excess of 16 will scroll across the display for the bottom line).
Bottom Line User String	The bottom line up to 40 characters.

Configuration: System > SNMP Traps

SNMP Traps are a subset of the SNMP management component of the VBrick. Use of any element of the SNMP management system requires use of an SNMP browser or SNMP

manager application (not supplied). The SNMP MIB, which formally defines the SNMP interface to the VBrick, is contained within the install directory of the VBrick release or from the VBrick. The two MIB files are `VBrick_box2.mib` and `VBrick_reg.mib`. *The default installation directory is:*

`Program Files\VBrick\VB6000\Download\ReleaseVxx_xx_xx`

Traps are SNMP base messages used by SNMP elements to report changes in status or alarm conditions to remote SNMP management entities. Traps are generally used to alert network administrators of potential equipment problems or other noteworthy events. Two types of information are conveyed in the trap mechanism: Events and Alarms. Events Traps are sent every time the monitored event occurs. Events have only one state. Alarms are events having two states, Active and Clear. When the alarm condition is first detected, an alarm active trap is emitted. Alarms are considered active until the condition cleared and the alarm clear trap is emitted.

Note VBrick supports SNMPv3 in addition to SNMP v1/v2. SNMP v3 is a "Secure SNMP implementation" as defined in Section 11.3 of RFC 3414. It provides initial configuration in accordance with Appendix A.1 of RFC 3414 and also implements the Privacy Protocol (DES Encryption) as described in RFC 3414.

Trap Destination IP Address (1–4)	The IP Addresses of SNMP management stations to which traps are to be sent. The SNMP management application should be active on these stations in order to receive a number of SNMP Traps, which are supported by the VBrick. Enterprise-specific traps listed in order of trap identification number are shown in Table 4.
Host Type	IP Address or DNS Host Name.
IP Address	Complete if Host Type = IP address.

DNS Host Name	Complete if Host Type = DNS Host Name.
SNMP Trap Version	Select Version number.
Trap User Name	User assigned trap name.
Authentication Password	Enter password. Cannot exceed 20 characters. May include any combination of alphanumeric characters but only the following special characters: ~ ! # \$ ^ * + & [] { } < > See Table 5 on page 93 for defaults.
Authentication Protocol	Select protocol: MD5 or SHA to validate the transaction between a given host and client
Privacy Password	Required. Hides traffic using DES encryption.
Security Level	No Authentication, No Privacy (default). No Privacy. Authentication and Privacy.

Table 4. Trap Summary Tables

Number	Event Description
1	There is loss of video input on slot1 Encoder.
2	The loss of video input on slot1 Encoder failure has cleared.
3	There is loss of video input on slot2 Encoder.
4	The loss of video input on slot2 Encoder failure has cleared.
5	The box has started up in Run mode.
6	The box has started up in Diagnostics mode.
7	The box has started up in Limited Run mode.
8	The box has received a reset request from an administrator.
9	There is a fan failure.
10	The fan failure is recovered.
11	The temperature of the unit is out of range. Will be sent when the unit's internal temperature becomes too high or too low.
12	The temperature out of range condition has cleared.
13	The 24 volts power supply failed.
14	The 24 volts power supply failure has cleared.
15	The 12 volts power supply failed.
16	The 12 volts power supply failure has cleared.
17	The 5 volts power supply failed.
18	The 5 volts power supply failure has cleared.
19	The 3.3 volts power supply failed.
20	The 3.3 volts power supply failure has cleared.

Number	Event Description
21	The 2.5 volts power supply failed.
22	The 2.5 volts power supply failure has cleared.
23	There is a Real Time Clock battery failure.
24	The unit has been configured to transmit and/or receive video streams beyond its capability.
25	Signifies the overloaded unit is recovered to normal.
26	A component on the main board failed Power On Self Test (POST).
27	The encoder card in Slot1 failed Power On Self Test (POST).
28	The encoder card in Slot1 failed Power On Self Test (POST).

Configuration: System > Security

The screenshot shows the VBrick Integrated Web Server Administration/Configuration page. The page title is "VBrick INTEGRATED WEB SERVER Administration/Configuration". The navigation menu includes CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The left sidebar shows a "Configuration" menu with options: Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main content area is titled "Configuration: System" and has tabs for "General", "SNMP Traps", "Security", and "Logging". The "Security" tab is active, showing the following settings:

External Telnet Server	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
External FTP Server	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
External IWS	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
External SNMP	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
External SNMPv1 and SNMPv2 Access	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
Remote Support Enable	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
Remote Support Poll Enable	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled

Below the settings, there are two input fields: "Remote Support Server" with the value "remote.vbrick.com" and "IWS Server Port" with the value "80". At the bottom, there are four buttons: "END EDIT", "SAVE CONFIG", "APPLY", "REVERT", and "DEFAULTS".

Note If you disable Telnet, FTP, IWS, and SNMP, the only way to manage (and re-enable) these parameters is to connect a PC to the VBrick with a serial cable and use the Command Line Interface (CLI). You should never disable all the network management interfaces if you are using COM2 for serial passthrough.

External Telnet Server	Default = Enabled. Disabled will prevent Telnet sessions to the server.
External FTP Server	Default = Enabled. Disabled will prevent FTP sessions to the server including downloading to the VBrick. Note that this feature must be enabled to upgrade the appliance firmware using VBDownload.
External IWS	Default = Enabled. Disabled will prevent you from managing the VBrick from a web browser using the IWS application.

External SNMP	Default = Enabled. Disabled will prevent you from using an external MIB browser to view or write parameters.
External SNMPv1 and SNMPv2 Access	Default = Enabled. You can use both SNMP v1/v2, and v3. For tightest security, set parameter to Disabled and use SNMPv3 only.
Remote Support Enable	Default = Disabled. Check to enable remote support by VBrick Support Services. <i>Note: Any change to this parameter will reboot the appliance.</i>
Remote Support Poll Enable	Default = Enabled. The default enables continuous polling through the firewall. If desired, you can enable polling only when you need to establish a remote connection. <i>This will not reboot the appliance.</i>
Remote Support Server	Default = remote.vbrick.com . Use the default if a DNS server is defined on the Configuration: Network > Ethernet page. If a DNS server is not defined, you must enter an IP Address in this field. Contact Support Services for details.
IWS Server Port	Specifies the listener port for management and HTTP connections. Default = 80. Typically port 80 is the default value used by PC web browsers. To access a different HTTP port, the remote IWS client user would specify the URL as follows: http://IPaddress:port where IPaddress = VBrick IP address or hostname, and port.

Improving Security

You can improve security by (1) blocking unauthorized attempts to login and access a device and (2) by reducing exposure to malicious software attacks. The most common vulnerability is related to user accounts and passwords. After a successful installation, you should immediately change the default passwords. Many attacks come from within an organization and this helps to minimize the risk. The IWS login is generally secure since it utilizes encryption techniques to hide usernames and passwords from network spyware.

Malicious software covertly attaches itself to unsuspecting devices. These programs are generally designed to compromise personal information or to create system havoc. Since the VBrick appliance uses an industrial-grade operating system, it is less susceptible to malicious software and unlikely to be a target of programs designed to attack PC-based systems like Microsoft, Linux, and others. However, you can still take additional steps to minimize risk. VBrick tries to make installation as simple and quick installation and many features are automatically enabled by default even though you may not need them. You can selectively disable unneeded features to reduce vulnerability. Another common problem is Denial of Service (DoS) attacks. A DoS sends floods of packets to an unsuspecting remote system in an attempt to disrupt or stop normal operation. These unsuspecting remote systems are typically discovered using ICMP or ping. It is standard industry practice to block all ICMP and ping requests from off-net foreign hosts. This is typically done in a centralized location using router/firewall technology which is more successful and cost effective than resolving the issue at each host.

Configuration: System > Logging

Certain log events are captured and can be viewed locally. This local log is saved in volatile memory and hold the most recent 20 entries. See [Status: System Log](#) on page 73 for examples of log information. To save log information indefinitely, it is recommended that remote logging be utilized. Remote servers generally offer ample storage and offer the additional

benefit of collecting log information from several VBricks simultaneously. When logging externally, specify either the IP address or hostname a server that is configured to receive SNMP traps on port 162 into the Remote Event Log IP Address or Remote Event Log DNS Host Name fields.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "VBrick INTEGRATED WEB SERVER Administration/Configuration". The navigation menu includes CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The left sidebar shows a "Configuration" menu with options: Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. The main content area is titled "Configuration: System" and contains a sub-section "General SNMP Traps Security Logging". The configuration options are as follows:

Log Time Zone	<input checked="" type="radio"/> Local <input type="radio"/> GMT
Trap Log Local	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
Trap Log Remote	<input type="radio"/> Disabled <input type="radio"/> Enabled
General Config Log Local	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
General Config Log Remote	<input type="radio"/> Disabled <input type="radio"/> Enabled
IR or Script Config Log Local	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
IR or Script Config Log Remote	<input type="radio"/> Disabled <input type="radio"/> Enabled
Remote Event Log Host Type	<input checked="" type="radio"/> IP Address <input type="radio"/> DNS Host Name
Remote Event Log IP Address	<input type="text"/>
Remote Event Log DNS Host Name	<input type="text"/>

At the bottom of the configuration area, there are four buttons: END EDIT, SAVE CONFIG, APPLY, REVERT, and DEFAULTS.

Log Time Zone	Specifies the time zone (Local or GMT) that is used for logged events.
Trap Log Local	If Enabled, displays trap events in the local log.
Trap Log Remote	If Enabled, sends trap event notices to a remote host.
General Config Log Local	If Enabled, displays configuration changes in the local log.
General Config Log Remote	If Enabled, sends configuration change notices to a remote host.
IR or Script Config Log Local	If Enabled, displays IR or script-generated configuration changes in the local log.
IR or Script Config Log Remote	If Enabled, sends IR or script-generated configuration changes to a remote host.
Remote Event Log Host Type	Identify remote event log server by host name.
Remote Event Log IP Address	Identify remote event log server by IP address.
Remote Event Log DNS Host Name	Host name of remote event log server.

Configuration: Video On Demand

This screen is used to configure the capability of the VBrick to support VBrick's legacy Video on Demand server (VBVoD). This is *not* the VoD server used with VBrick's ETV Portal Server.

Video On Demand	Enables or Disables the Video-on-Demand capability of the VBrick appliance. When enabled, the user will be able to view Video-on-Demand SAPs in the Program Guide. If authorized, the user will be able to select Video-on-Demand SAPs and access the Video-on-Demand features of the VoD server sending the SAP. If disabled, the user will not see Video-on-Demand SAPs in the Program Guide.
SAP IP Address	The IP Address for Video-on-Demand SAPs Default value is 224.2.133.135 (as shown).
SAP Port	The Port for Video-on-Demand SAPs Default value is 9880 (as shown).
SAP Timeout	The Video-on-Demand SAP timeout, in seconds. Default value is 90 (as shown).

Note The values of the SAP IP Address and Port must correspond to the values set on the VBVoD servers sending Video-on-Demand SAPs. If the values of the SAP IP Address or Port are changed without changing the values on the VoD servers, Video-on-Demand SAPs will not be received even if when Video-on-Demand is enabled.

Configuration: Script Management

Configuration: Script Management > Event Triggering

You can create and run scripts to activate certain functions on a VBrick appliance. There are three ways to run scripts on an appliance. (1) You can run scripts for test purposes using the **Run Script** button in IWS; (2) you can use the IR Remote Control; and (3) you can use an external event trigger (see "Event Triggering" in the *VBrick Appliance Getting Started Guide*).

The VBrick appliance can be set up to use serial (COM1) Pins 7 and 8, or 0 through 9 on the IR Remote as input events to trigger the VBrick to run scripts. The script files execute certain commands using VBrick SDK parameters to activate certain functions within the VBrick appliance. There are a total of four possible input events (COM1 Pin8 Low, COM1 Pin8 High, COM1 Pin7 Low, COM1 Pin7 High) and ten possible input events using the IR Remote (each has one associated script file).

For more information about the VBrick SDK, contact your certified VBrick reseller or VBrick [Support Services](#). To purchase the SDK directly from VBrick, go to: www.vbrick.com/products/purchase.asp.

Note You cannot execute a script either with the IR Remote Control or using an event trigger if IWS is currently running in **Edit** mode. If you run a script directly from IWS, it automatically exits **Edit** mode and terminates the active editing session.

Run Scripts Using IWS

You can run scripts that were previously created with the VBrick SDK using the **Run Script** button in IWS. This button is only available in **Edit** mode and is basically used for test purposes. See [Sample Script](#) below.

APPLY **REVERT** **DEFAULTS**

Figure 2. Script Management – Part 1

Click here to read or write script files	Login to the VBrick via FTP and manage script files. Requires a valid user name and password.
Event Enable	Allows the user to Enable/Disable Event Triggering for each input event.
Event Stable Time	Allows the user to enter the amount of time in milliseconds that each input event has to be stable at the active level before the script will be executed.

Figure 3. Script Management – Part 2

Event Count	Displays the number of times each input event has occurred.
Event Script Status	Displays current status information for each event script.
Run Script	These buttons allow the user to run each script without needing the input event. Use this method to test the script.
IR Remote Scripts	are enabled by simply placing a file named <code>irNScript.txt</code> (where N is a number from 0–9) in the script directory of the unit. For example naming the following script <code>ir0Script.txt</code> will enable the 0 on the IR remote to trigger the unit to run the script.

Run Scripts Using the IR Remote Control

IR Remote Control scripts are enabled by simply placing a file named `irNScript.txt` (where **N** is a number from 0–9) in the script directory of the unit. For example naming the following script `ir0Script.txt` will enable the 0 on the IR remote to trigger the unit to run the script.

Run Scripts Using Event Triggers

The event triggering feature lets you use an external switch or power source to control the functions of the VBrick appliance. See "Event Triggering" in the *VBrick Appliance Getting Started Guide* for detailed examples.

Sample Script

```
vbrickSlot2EncoderNetworkTransmitEnable = 2 // set enable slot 2 encoder transmit
vbrickSlot2EncoderNetworkApplySet = 2 // apply above encoder network set
* // end of a group

vbrickHDRRecorderControlMode = 1 // set recorder to user controlled mode
vbrickHDRRecorderControlIrEnable = 1 // disable recorder ir control
vbrickHDRRecorderControlName = event1record.mpg // set recorder file name
vbrickHDRRecorderControlDuration.value = 30 // set recorder duration to 30 seconds
vbrickHDRRecorderControlBatchEnable = 1 // set recorder batch to disabled
vbrickHDRRecorderControlApplySet = 2 // apply above recorder control sets
* // end of a group

vbrickHDRRecorderControlFtpEnable = 1 // disable auto ftp after record
vbrickHDRRecorderControlApplySet = 2 // apply above recorder control set
vbrickHDRRecorderNetworkReceiveType = 1 // set recorder receive type to ip address
vbrickHDRRecorderNetworkReceiveIpAddr = 239.22.129.3 // set recorder receive ip address
vbrickHDRRecorderNetworkReceivePort = 4443 // set recorder receive port
vbrickHDRRecorderNetworkApplySet = 2 // apply above recorder network sets
* // end of a group

vbrickHDRRecorderOperationStart = 2 // start recording
* // end of a group

wait = 5000 // wait for 5000 milliseconds
* // end of a group

vbrickSlot1EncoderNetworkTransmitEnable = 2 // set enable slot 1 encoder transmit
vbrickSlot1EncoderNetworkApplySet = 2 // apply above encoder network set
* // end of a group
```

Scripting Notes

- * denotes end of group.
- Each group can have a maximum of six sets.
- Each group must have apply sets for all normal sets.
- Wait state will be alone in a group.
- There is no clear command.
- Script commands must start in column 1.
- There is no chaining of scripts.
- Comments will start with / and can be a line or the end of a command.
- All scripts are executed in a strictly serial manner by a single task.
- While executing a script it is possible to miss a double change of any event.

Configuration: Script Management > Auto Configuration

Auto Config lets you perform an auto-configuration via a URL script file. It is typically used for remote configuration and troubleshooting or to configure VBrick appliances that are behind a firewall. To configure a parameter on an appliance (or more likely a set of parameters) you simply point the URL to a server with an .xml configuration file. This is useful, for example, to change a reflector URL, set the audio and video rates, etc. when the VBrick appliances are behind a firewall and cannot be accessed remotely.

The VBrick reads the URL field (e.g. www.myserver.com/config.xml) via HTTP protocol and executes the script depending on the **EXECUTE** tag. If a **VBEXECUTEFORCE** tag is present in the .xml file (see example below), the script runs every time at the poll interval even if it has not changed. If a **VBEXECUTEIFDIF** tag is present the script runs only if it is different from the last executed file. One of these tags is required.

If the VBrick is in **Edit** mode, the script file will not run until the edit session is ended. The auto config script will run *before* any waiting IR scripts or external event scripts. In **Edit** mode, you can press **Run Script** to execute the script on demand. After a reboot, the VBrick checks for a script URL and will run the script immediately, regardless of the **VBEXECUTE** tag value.

URL	Valid path to a URL script file, for example: www.myserver.com/config.xml . Default = blank.
Poll Rate	The rate at which the appliance checks the config file. 0–1440 minutes (default = 0).
Auto Config Status	Shows auto config status including when the script was last run, URL connection errors, etc. Press Refresh to update.
Run Script	Edit mode only. Run the script now.

Sample Script

The auto config script file ([config.xml](#)) is an .xml file with the following syntax. It can set any VBrick parameters and force an "apply" as needed. This example shows how to set various recorder parameters. Note that a **VBEXECUTE** tag is required.

```
<XML Header>
<?VBEXECUTEFORCE?> or <?VBEXECUTEIFDIF?>
<VBRICK>
vbrickHDRRecorderControlMode = 1
vbrickHDRRecorderControlIrEnable = 1
vbrickHDRRecorderControlName = event1record.mpg
vbrickHDRRecorderControlDuration.value = 30
```

```
vbrickHDRecorderControlBatchEnable = 1  
vbrickHDRecorderControlApplySet = 2  
</VBRICK>
```

SDI Configuration

Topics in this chapter

Introduction.....	57
Configuration: Encoder.....	58
Configuration: Decoder.....	59

Introduction

Serial Digital Interface (SDI) is mainly used in the professional broadcast industry and is based on the principal standard for broadcast television and motion pictures. Reliable, flexible and cost-effective video transport is critical to the video transmission industry, which provides state-of-the-art transport services for broadcast networks, content producers, entertainment programmers, news agencies and sportscasters throughout the world. SDI provides users the best available video quality with virtually no latency.

The Serial Digital Interface Encoder is a module that plugs into the encoder card, allowing the broadcast industry standard 270 Mbps serial signal to be converted to MPEG-2. The Serial Digital Interface input module accepts the Society of Motion Picture and Television Engineers industry-standard, SMPTE 259M-C compliant signals at 270 Mbps. The standard specifies a Serial Digital Interface (SDI) for digital video equipment operating at either the 525-line, 60 Hz or 625-line, 50 Hz video standard. After VBrick's MPEG-2 conversion, the compressed video can be transported and utilized over a standard IP network.

The SDI module extracts AES/EBU or non-AES/EBU audio from Group 1 channels 1 – 4 from the incoming 270 Mbps data stream. These audio channels are embedded into the SDI video stream and occupy space in the horizontal and vertical blanking interval. These four channels are extracted into two SDI stereo streams of audio. SDI 1-2 contains the stereo channels 1 and 2 from Group 1 of the embedded audio. SDI 3-4 contains the stereo channels 3 and 4 from Group 1 of the embedded audio. The SDI hardware can select either channels 1 and 2, or channels 3 and 4 from the SDI stream. Audio embedded in Groups 2, 3, and 4 of the SDI stream will not be extracted. If desired, the user may bypass any embedded SDI audio and provide analog audio input at the VBrick encoder. The SDI input module is available with model numbers ending in -x101, -x111, -x102, -x112.

The Serial Digital Interface output module is similar to the SDI input module; however, the output module provides an SDI signal to the end-user. The SDI output module plugs into the decoder card, allowing MPEG-2 to be converted to the broadcast industry standard SMPTE 259M-C, 270 Mb/s serial signal, or SDI. The SDI output module operates at either the 525-line, 60 Hz or 625-line, 50 Hz video standard. The decoder module does not provide EDH, or Error Detect Handling.

The SDI output module multiplexes one group containing channels 1 and 2 of stereo (L/R) audio into the serial video stream. Also included is the "standard" implementation of channel status, provided for professional or broadcast use per AES3-1992 (r1997). The user may still utilize the analog video and audio available at the decoder output while simultaneously using

the SDI output module. The SDI output module is available with model numbers ending in –x110, –x011, –x111, –x010, –x012, –x112.

Configuration: Encoder

The following sections explain how to configure SDI encoders and decoders. Note that closed captioning is not supported on SDI encoders or decoders.

Configuration: Encoder > Video

These parameters are used to configure the encoder video settings. The SDI (Serial Digital Interface) is only available on –xxx1/–xxx2 equipped units (see Status: User Information for part number). Several additional configuration parameters are available with SDI models. For SDI equipped units, everything is the same as for VBrick models ending in –xxx1/–xxx2, except for the fields shown below. Note that the **Hue** field is not available with SDI.

Configuration: Encoder

[Transport Video](#) [Audio](#) [Destination1](#) [Destination2](#) [Announce\(SAP\)](#)

MPEG2 Encoder Video - Slot1 [Slot2](#) [End](#)

Video Format	<input checked="" type="radio"/> NTSC <input type="radio"/> PAL <input type="radio"/> PALM
Video Aspect Ratio	4:3
Video Input Type	SDI
Video Source	Normal
Closed Caption	Disabled
Reference Distance	2
Intrapicture Distance	16
Luminance (0~255)	128
Contrast (0~127)	62
Saturation (0~127)	66
Vertical Offset Correction	<input checked="" type="radio"/> Off <input type="radio"/> On
SDI Cable Equalizer	<input checked="" type="radio"/> Off <input type="radio"/> On
Resolution	FullD1
Bit Rate (bit/sec)	5000000
Video GOP Time	Encoder Time
Meta Data	<input checked="" type="checkbox"/> Enabled

APPLY **REVERT** **DEFAULTS**

Vertical Offset Correction	This setting controls vertical offset correction for SDI appliances.
SDI Cable Equalizer	This setting allows selection of SDI Cable Equalizer settings. If set to on, the SDI Cable Equalizer maintains SDI signal quality when SDI cables have a length greater than 10 meters.

Configuration: Encoder > Audio

The encoder video and audio configurations for an SDI (Serial Digital Interface) equipped appliance are only available on a model ending in part number -xxx1/-xxx2 (see Status: User Information for part number). These parameters are used to set the SDI Encoder Audio Input settings. For SDI equipped units, everything is the same as for the models ending in -xxx1/-xxx2, except for the fields below.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The main navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. A left sidebar menu lists various configuration categories: Network, Encoder, Pump, Recorder, FTP File Transfer, Passthrough, System, and Script Management. The main content area is titled 'Configuration: Encoder' and features a breadcrumb trail: Transport Video Audio Destination1 Destination2 Announce(SAP). Below this, a tabbed interface shows 'MPEG2 Encoder Video - Slot1' (with 'Slot2' and 'End' tabs). The configuration fields are as follows:

- Video Format: NTSC PAL PALM
- Video Aspect Ratio: 4:3
- Video Input Type: SDI
- Video Source: Normal
- Closed Caption: Disabled
- Reference Distance: 2
- Intrapicture Distance: 16
- Luminance (0~255): 128
- Contrast (0~127): 62
- Saturation (0~127): 66
- Vertical Offset Correction: Off On
- SDI Cable Equalizer: Off On
- Resolution: FullID1
- Bit Rate (bit/sec): 5000000
- Video GOP Time: Encoder Time
- Meta Data: Enabled

At the bottom of the configuration area are three buttons: APPLY, REVERT, and DEFAULTS.

SDI Audio Input	Input can be through 1/8" mini-phono jack, from AudioMate, or from within the SDI data using SDI 1-2 or SDI 3-4.
Audio Gain	If SDI 1-2 or SDI 3-4 is chosen as the audio input, the audio gain settings have no effect.

Configuration: Decoder

The SDI decoder does not display any additional fields in IWS. If an SDI board is present, connecting to the output will produce SDI out of the appliance including Composite, S-Video, SDI, and Audio (analog and SDI). When a VBrick encoder is optioned with SDI video input with PIP enabled the video that will be displayed in the PIP screen will originate only from the standard NTSC video inputs and not from the SDI input.

Note The MPEG-2 SDI decoder outputs audio via SDI and analog audio at the same time. SDI audio is sent in SDI audio channels 1-2; it is also sent in SDI audio channels 3-4.

Status

The Status menu lets you view information and status relative to the VBrick appliance. The **Refresh** button allows the user to update the statistics to display the most current values. A **Reset** button is also present on some screens, allowing a user to reset all statistic counters.

Topics in this chapter

Status: System Information	61
Status: Network Status	63
Status: Decoder Status	66
Status: Encoder Status	68
Status: Hard Drive Status	70
Status: FTP Server Status	73
Status: System Log	73
Status: User Information	75

Status: System Information

This menu allows the user to view vital system information. Some of this information represents parameters describing the VBrick as shipped; others provide information concerning the current VBrick operation.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. At the top, there is a navigation bar with links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is divided into two sections. On the left, there is a 'System Status' sidebar with a list of links: System Information, Network Status, Decoder Status, Encoder Status, Hard Drive Status, FTP Server Status, System Log, and User Information. Below this list is a green 'END EDIT' button. The main section is titled 'Status: System Information' and contains several data blocks. The 'System Model' block shows '6200'. The 'Device State' block lists various system parameters: MAC Address (00:07:df:00:8d:a1), MAC Address Valid/Invalid (Valid), Current Operational Mode (Run), DHCP Status (Disabled), Temperature(Celsius) (47), Fan State (Not Operational), Battery Status (OK), and Overloaded Count (0). Below this is the 'Power Supply Voltage' block, which lists voltages for 24V (23.98), 12V (11.94), 5V (5.04), 3.3V (3.30), and 2.5V (2.46). At the bottom of the main section are two green buttons: 'REFRESH' and 'RESET'.

System Model	Displays the model number of the appliance.
MAC Address	Displays the MAC (Media Access Control) address of the appliance.
MAC Address Valid	Verifies that the MAC address is valid.
Current Operational Mode	<p>Indicates the current operational mode of the VBrick. The following modes are supported:</p> <ul style="list-style-type: none"> • Run Mode – Normal operation. • Diagnostics – User selected mode for running certain VBrick diagnostics. • Limited Run Mode – Limited operational mode (not selectable). Normally occurs if a hardware problem exists within the VBrick but it can still partially operate. • Overloaded Mode – Limited operational mode (not selectable). This mode occurs when the VBrick is configured to handle more video than its operational capacity. It automatically reconfigures itself to allow continued remote and local management. If this occurs, the VBrick needs to be reconfigured to reduce the number of streams and/or data rates. Under this condition, the appliance temporarily reduces video traffic in order to maintain IWS functionality.

DHCP Status	<p>Dynamic Host Configuration Protocol – Ethernet models only. Enabled/Disabled. Possible DHCP Status values:</p> <ul style="list-style-type: none"> • Disabled • Succeeded • Failed • Succeeded without Subnet Value – No subnet value given; generated from IP address. • Succeeded with Invalid Subnet Value – Invalid subnet value given; generated from IP address. • Failed over Backplane – Device number invalid in backplane. • Failed, Invalid Device Unit – Network interface device number invalid. • Failed Invalid Cookie – Network interface inoperable. • Failed, Bind Failed – DHCP server not available or appliance not connected to network. • Failed, Out of Memory – Appliance is out of memory. Indicates a severe condition. • Failed, Parameter Get Failed – Couldn't retrieve a DHCP parameter needed/requested. • Failed, Invalid Boot File – Invalid boot file specified. Indicates a severe condition. • Failed, Invalid Retrieved IP address assigned by the server is not a valid unicast address.
Temperature	Displays the temperature of the appliance (Celsius).
Fan State	Displays the state of the fan as Not Operational , High or Low .
Battery Status	OK or Failed.
Overloaded Count	Provides a count of the number of times the box has entered the Overloaded state.
CPLD version	Displays the Main Board programmable device version number.
Boot Revision	Displays the date of the last boot revision.
Code Revision	Displays the date of the last code revision.
Release Revision	Displays the release version number.
CPU Utilization%	The percentage of the Central Processor in use at this time.
Power Supply Voltage	Displays the measured voltages present and provided to the VBrick (24V, 12V, 5V, 3.3V 2.5V). The tolerance range for 24V is minimum 18V to maximum 25V. The range for all other voltages is plus or minus 5%.

Network Port Mode	Full Duplex

Interface	Extra Stream Count	Misdirect IP	Orphan Count
Ethernet	0		0

REFRESH **RESET**

General

COM1/COM2 Passthrough Operational State	<p>The current operational state of COM1/COM2 serial Passthrough port. There will be a conflict if the slot selected through the Passthrough Destination parameter has neither an encoder nor a decoder present; or has an encoder with a multicast destination; or has an encoder with no configured destination. The possible values are:</p> <ul style="list-style-type: none"> Disabled Enabled Active Enabled Conflict No Enc Or Dest Enabled Conflict Enc Multi Dest Enabled Conflict Enc No Dest Enabled Internal Error Enabled Rejected No Dedicated IP Addr
Conferencing State	<p>This setting indicates the unicast call state of the encoder.</p> <ul style="list-style-type: none"> Free – Available for a conference. Busy – The VBrick is currently engaged in a conference. Disabled – The conference feature has been disabled. Unknown – The VBrick is in a transition state.
Active RFC-SAP Count	<p>This is the number of SAP sessions the appliance is currently listening to for the purpose of RFC 2974-compliant SAP timing. This field displays values when SAP timing is configured for RFC 2974 mode.</p>
Network Port Status	<p>The status of the Ethernet network interface: Link OK or No Link.</p>
Network Port Speed	<p>The speed of transmission for the Ethernet network interface: 10Mbit or 100Mbit.</p>
Network Speed Mode	<p>The mode of transmission for the Ethernet network interface: Full Duplex or Half Duplex.</p>

Interface

This section reports the existence of any undesired (and unrequested) video streams being received by the VBrick. Unrequested streams greater than 1.5 Mbps are automatically flagged and dropped. The reporting is made for each IP interface individually. On Ethernet models, only one interface exists.

Extra Stream Count	Number of unexpected video streams being received on this interface.
Misdirect IP Address	The IP Address of the appliance transmitting one of the extra video streams received on this interface.
Orphan Count	Orphans are packet fragments received that do not have corresponding head PDUs.

Status: Network Status > Routing

REFRESH

Destination Network	Defines a target network (or device) that can be contacted via the system. A value of 0.0.0.0, is used to indicate a default routing entry. The 127.0.0.1 is always present and identifies the loopback route.
Local Gateway IP	Defines the intermediary network device (or entity) which is responsible for IP forwarding to the given destination network specified in the first column.
Network Mask	Defines the destination network's address scope specified in the first column. Mask bits which are zeros, identify the host portion of the address space. Bits that are "ones" identify the network portion.

Status: Network Status > Network Time

The screenshot shows the 'Status: Network Status' page. On the left is a 'System Status' sidebar with a list of menu items: System Information, Network Status, Decoder Status, Encoder Status, Hard Drive Status, FTP Server Status, System Log, and User Information. Below this list is an 'END EDIT' button. The main content area is titled 'Status: Network Status' and contains a breadcrumb trail: CODEC Routing Network Time IPv6. Below the breadcrumb is a table for 'Network Time Synchronization' with the following data:

Network Time Synchronization	
Last Successful Update	TUE JUL 10 09:58:24 2007
Network Time Client State	Time Update

Below this is a section for 'Primary Network Time Server' with the following data:

Successful Update Counter	490
Failed Update Counter	0
Current Server Status	Server Active

Below that is a section for 'Secondary Network Time Server' with the following data:

Successful Update Counter	0
Failed Update Counter	0
Current Server Status	Server Standby

At the bottom of the main content area are two buttons: 'REFRESH' and 'RESET'.

Status: Network Status > IPv6

The screenshot shows the 'Status: IPv6 Status' page. On the left is a 'System Status' sidebar with a list of menu items: System Information, Network Status, Decoder Status, Encoder Status, Hard Drive Status, FTP Server Status, System Log, and User Information. Below this list is an 'END EDIT' button. The main content area is titled 'Status: IPv6 Status' and contains a breadcrumb trail: CODEC Routing Network Time IPv6. Below the breadcrumb is a table for 'IPv6 Addresses' with the following data:

fe80::207:dfff:fe00:8da1
2001:db8:2222:22:207:dfff:fe00:8da1

Status: Decoder Status

MPEG-2 Decoder Status

This menu lets you view vital Decoder statistics. As you **Refresh**, the **Source IP Address** and **Bytes Transferred** fields are updated. If you see decoder sync, lost sync count, non-video packets and unexpected fragments counts increase you should investigate your network.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. At the top, there is a navigation bar with links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled 'Status: Decoder Status'. On the left, there is a 'System Status' sidebar with a list of menu items: System Information, Network Status, Decoder Status (highlighted), Encoder Status, Hard Drive Status, FTP Server Status, System Log, and User Information. Below the sidebar is an 'END EDIT' button. The main content area displays a table of decoder status information for Slot2. The table has two columns: 'Decoder Status' and 'Slot2'. The rows include Decoder State (Wait For PID Interrupt), Receive State (Receive enabled), Transport Rate (0), Source IP Address (0.0.0.0), Bytes Transferred (0), Buffer Full Count (0), Decoder Sync. State (No Sync.), Lost Sync. Count (0), Packets Received (0), Non Video Packet (0), Unexpected Fragments (0), Packet Ordering (Disabled), and Jitter Queue Status (Disabled). Below the table are two buttons: 'REFRESH' and 'RESET'. At the bottom, there are revision details for Audio Micro-code, Video Micro-code, FPGA, CPLD, Decoder Aux. CPLD, and PLX EEPROM.

Decoder State	<ul style="list-style-type: none"> • Displays decoder state from the decoder standpoint. • Idle • Setup Transport • Setup PCR And PID • Wait For STC Interrupt • Look For STC Active • Setup Elementary Streams • Setup Elementary Decoders • Audio STC Access Error • Normal Run • Start Channel Change • Wait On Both Audio Channels Change • Wait On Audio 1 Channel Change • Wait On Audio 2 Channel Change • Video Drain Command • Wait On Video Drain • Restart Video And Audio • Illegal • Wait For PID Interrupt • Transport Buffers Drain State • Wait On Transport Time Out
Receive State	Displays the detailed state of the decoders receive operation.
Transport Rate	The measured transport rate received by this decoder.
Source IP Address	The IP Address of the video source.

Bytes Transferred	The number of receive bytes transferred.
Buffer Full Count	The number of times the decoder buffer filled to capacity.
Decoder Sync State	Indicates whether the MPEG-2 transport layer has achieved its synchronization. Most likely indicates a configuration or network problem.
Lost Sync Count	The number of times the decoder has acquired synchronization with the transport stream (see note under Unexpected Fragments).
Packets Received	The count of IP packets received.
Non Video Packet	The count of packets directed to this decoder, which are not part of the video stream.
Unexpected Fragments	The number of mis-ordered packets received. Each appliance maintains a statistical report on Unexpected Fragments received from a particular video stream. Note: If multiple devices in the same unit (i.e. decoder or hard disk) are tuned to the same stream, the Unexpected Fragments count on Slot1 is used exclusively to report statistical results.
Packet Ordering	Packet ordering status. Packet ordering is temporarily disabled under conditions, such as the IP ID is not increasing or disabled, or the access method does not support reordering. Packets arriving over Ethernet can be reordered.
Jitter Queue Status	Status of the jitter Q. It is generally equal to the value of the Jitter Queue of the decoder with the following exception: if a variable transport (video, audio and idle frames included) rate stream is being decoded then the jitter queue will be temporarily disabled. The Jitter Queue will be re-enabled when the decoder senses that a video stream of fixed rate transport is being received.
Audio Micro-code Revision	Revision of the audio microcode on the decoder chip.
Video Micro-code Revision	Revision of the video microcode on the decoder chip.
FPGA Revision	Revision of the FPGA chip on the decoder daughter card.
CPLD Revision	Revision level of the CPLD on the decoder daughter card.
PLX EEPROM Revision	Revision level of the PLX EEPROM on the decoder daughter card.

Status: Encoder Status

This menu allows users to view vital Encoder statistics. As you **Refresh** you should see **Transmit State – Transmitting** and the **IP Bytes Transferred** count should increment. If this does not happen check your VBrick's encoder configuration or network.

MPEG-2 Encoder Status

Note The MPEG-2 encoder is designed to stream video indefinitely when it has a valid video input and will stream black video for up to a few hours when the video input is missing or invalid. However, if the video input has been invalid for more than a few hours you should either reset the encoder or restart it by making an audio or video configuration change.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The main content area displays the 'Status: Encoder Status' for 'Slot1'. On the left, there is a 'System Status' sidebar with a list of menu items: System Information, Network Status, Decoder Status, Encoder Status, Hard Drive Status, FTP Server Status, System Log, and User Information. Below the sidebar is an 'END EDIT' button. The main content area is divided into sections: 'General', 'Destination1', and 'Destination2', each with a table of status parameters. At the bottom, there are 'REFRESH' and 'RESET' buttons.

General	
Encoder State	Running
Micro-Code Revision	84410368
FPGA Revision	18.0.0 02/12/03 10:05
PLX EEPROM Revision	2

Destination1	
Transmit State	Transmitting
IP Bytes Transferred	1531293688
Buffer Full Count	0
IP Packets Sent	79603912

Destination2	
Transmit State	Transmitting
IP Bytes Transferred	1531302656
Buffer Full Count	0
IP Packets Sent	217863346

Encoder State	Running indicates normal operation. Video Input Problem indicates a problem with the video source. Verify that the video source is working correctly and that your video cable is good. Verify that the Configuration: Encoder > Video > Video Input Type is properly set to Composite or S-Video to match your source connection. Verify that Configuration: Encoder > Video > Video Format is properly set to NTSC or PAL to match your source format. Note that the WM encoder will transmit black video when there is an input problem.
Micro-Code Revision	Displays the encoder micro-code revision.
FPGA Revision	Displays the FPGA revision number.
PLX EEPROM Revision	Displays the EEPROM revision number.
Transmit State	Displays Transmitting or Not Transmitting .
IP Bytes Transferred	Number of bytes sent across the network
Buffer Full Count	Displays any full buffer counts that occur.
IP Packets Sent	Displays the number of packets sent across the network.

Diagnostics

Topics in this chapter

Overview	79
Diagnostics: Network Tests	79
Diagnostics: Device Test	83
Diagnostics: Decoder Color Bars	84
Diagnostics: Hard Drive	85

Overview

There are two groups of diagnostics: Low Level Hardware Diagnostics and User Diagnostics. Low Level diagnostics are run in **Diagnostics** mode. User diagnostics are run in normal **Run** mode. (The **Configured Operational Mode** is set in Configuration: System as described below.) You must be in **Diagnostics** mode to run Hard Drive Check Disk and Device Test POST Tests. You can run all other tests from **Run** mode.

Note Since running in **Diagnostics** mode interrupts the passing of video, be sure to return the appliance to the **Run** mode in order to return the appliance to its normal operational state.

- ▼ To change between normal **Run** mode and **Diagnostics** mode
1. Log in with Administrator or Operator Privilege. The default login Username and Password is **admin/admin** or **operator/operator** (case sensitive).
 2. Go to the **Configuration: System** screen.
 3. Click **Begin Edit**.
 4. Set **Configured Operational Mode** as required.
 5. Click **Apply Changes**.
 6. The VBrick will then automatically save the changes and reset.

User Diagnostics

There are four user diagnostics: Network Test, Device Test, Decoder Color Bar, and Hard Drive.

Diagnostics: Network Tests

Diagnostics: Network Tests > Ping Test

This menu allows the user to initiate a data test from one VBrick to another. To Ping another VBrick, it's necessary to enter Edit mode. Enter the IP address and Test Settings and select the **Start** button. The Operational State will read **Ping Test**. After the test is completed, use the **Refresh** button to display the results of the test. The results of the test will be displayed in

the top portion of the screen. If the test is interrupted by pressing the Stop button, the results of the test prior to termination will be displayed.

Address Mode	Select IP Address or Host Name and enter a corresponding value.
Number of Packets	Number of packets to send for the test (default = 4).
PDU	Protocol Description Unit size of packets, in bytes (default = 64).
Transmit Interval	In seconds (default is sending the packets in 1 second intervals).
Transmit Timeout	The length of time, in seconds, before the test times out, in the event the target device fails to respond.

Diagnostics: Network Tests > Trace Route Test

The Internet is a large and complex aggregation of network hardware, connected together by gateways. Tracking the route packets follow or finding a gateway where the packets are being discarded is difficult. The Trace Route test attempts to trace the route an IP packet follows to a specified Internet host. This test utilizes the Time To Live (TTL) field in the IP header to allow intermediate nodes to be "discovered" via Internet Control Message Protocol (ICMP). Intermediate hops are discovered by launching probe packets with a small TTL and then listening for an ICMP Time Exceeded reply from a gateway. Use **Refresh**, **Start/Stop**, and **Default** to run the test.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled "Diagnostics: Network Tests" and includes a sidebar with a "Diagnostics" menu containing "Network Tests", "Device Test", "Decoder Color Bars", and "Hard Drive". The "Network Tests" option is selected. The main content area displays the "Operational State: Trace Route Test" section, which includes a "Trace Route Test Result" section showing "Resolved Ip Address" as 0.0.0.0 and "Overall Result" as empty. Below this is the "Trace Route Test Setting" section, which includes "Address Mode" (radio buttons for "IP Address" and "Host Name"), "IP Address" (text input field with "127.0.0.1"), "Host Name" (text input field with "localhost"), and "Probe Count" (text input field with "3"). At the bottom of the settings section are buttons for "REFRESH", "STOP", and "DEFAULTS". On the left side of the main content area, there are buttons for "END EDIT" and "RESET BOX".

Operational State	The currently selected test.
Address Mode	Select IP Address or Host Name and enter a corresponding value.
IP Address or Host Name	Enter the information in the corresponding box.
Probe Count	Can be set from 3 to 20. The default setting is 3. This setting is the number of probe packets sent to a host at each hop.

Trace Route Test Results

The results of the test appear at the top of the screen. The results include the Resolved IP Address of the Destination Host Name. When the test is finished or stopped, the Overall Result will display the result of the test, such as "Test Done," or "Max hops (=30) Finished," or "Test Stopped," etc. An entry shows the hop number, which is equal to the TTL, IP address (and Host Name if available) of the gateway, and round trip time of each probe. If the probe answers are received from different gateways, the address of each responding system will be shown. If there is no response within a 5 second timeout interval, a "*" is printed for that probe. If the result string exceeds 255 characters, the string will be terminated by ending it with "Too Long."

DEFAULTS

Diagnostics: Network Tests > Data Test

Data tests are used primarily to test the integrity of a network connection between two VBricks. A loopback test takes all data received at the video IP port and retransmits the data to the configured transmit IP destination. A loopback test may be used to observe the quality of the video data after looping back at the destination. A loopback test is available only for encoder-decoder models and is bi-directional. If appliance "A" is set in "loop back," it will return any stream back to the originator.

Cell tests allow generation of a known data pattern and checking of the integrity of the data pattern on reception. This test is often useful to verify a network service line before video deployment. The transmit encoder generates the pattern and the receive decoder checks the pattern. Statistics indicating good packets and identifying bad packets are provided in the receive appliance. If you are using encoder-decoder models, the preferred method for running cell tests is to initiate and terminate the test on one VBrick and to put the other VBrick into loopback. The encoder can be configured to send a test pattern to any decoder that receives and performs integrity checks. The network destination address in both the encoder and decoder screens is used to direct all test packet data across the network. For this test scenario, the test may be run in a timed mode or continuously. Statistics are updated on the IWS page when you click the **Refresh** button.

Cell test is available for encoder-decoder, encoder only, and decoder only appliances. In this mode the encoder VBrick transmits the data pattern and the decoder VBrick receives and

validates the data pattern. In this mode the following steps are recommended. No timed or continuous option is available for this test mode.

- Turn on transmit
- Turn on receive
- Turn off receive
- Turn off transmit

DEFAULTS

Diagnostics: Device Test

This screen shows the results of the Power-On Self Test, which is automatically run when the VBrick is reset or powered on. Other than that, running this test allows the operator to test the hardware integrity of the VBrick appliance board by running the test one or more times or by setting the test for continuous operation or for a certain number of test loops. This test is not often used. It is necessary to be in Diagnostic mode before running these tests. Enter Diagnostic mode from the **Configuration > System** screen. Don't forget to return to **Run** mode after the tests are run. You must be in **Edit** mode before you can run this test. Test Results include **Pass, Fail, Not Present**. Note that depending on the model, a low intensity test sequence may take 5-15 seconds per test sequence; a high intensity test sequence can take 5-15 minutes or more.

06/13/2007 08:55:14	06/13/2007 14:57:34	00:000 06:02	RESET
06/12/2007 15:14:49	06/13/2007 08:54:19	00:000 17:39	RESET

System Description	Company name, model and serial number of appliance.
System Name	Name of the system (for example Hall 23-B).
System Location	Location of system (for example Washington Building).
System Contact	Contact name.
System Up Time	Displays the time elapsed since the last system reset or power cycle.

Total System Up Time	Displays the total time that the unit has been powered up.
----------------------	--

Note The Device Information table creates a date and time stamp for every power or reset event. When SNTP is enabled, the unit must reboot to synchronize time with the SNTP server time. If the time moves dramatically forward (or backward), a discontinuity may appear in the device table because of the SNTP time correction.

Maintenance: Default All Configuration

This menu allows the user to default all the configuration parameters of the VBrick.

Default All	Sets all parameters except IP address, Subnet Mask, Gateway IP, User Names, Passwords and System Date Time.
Factory Defaults	Sets all parameters including IP Address and associated settings to factory defaults with the exception of System Date and Time.

Maintenance: Read/Write Configuration

Maintenance: Read/Write > Read From Device

The Read/Write Configuration page allows you to read configuration parameters from the VBrick to a file, as well as write configuration parameters from a file to the VBrick. The file is an .xml file and Internet Explorer is the assumed browser.

Note The VBrick appliance the .xml file is read *from*, and VBrick appliance the .xml file is written *to*, must be running the same version of code.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. At the top, there is a navigation bar with the VBrick logo and the text 'INTEGRATED WEB SERVER Administration/Configuration'. Below this is a green navigation menu with links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled 'Maintenance: Read/Write Configuration'. On the left, there is a 'Maintenance' sidebar with a list of options: Device Information, Default All Configuration, Read/Write Configuration (which is selected), and Change User Names & Passwords. Below the sidebar is a green 'END EDIT' button. The main content area has a 'Read From Device' button and a 'Write To Device' button. Below these is a 'Read Configuration Data From Device' section with a 'Read' button and the text 'Read Data From Device'. A note at the bottom states: 'Note: You can [click here](#) to download style sheet for viewing configuration data off-line. Please do not rename the style sheet file (XSL), and save it to the same directory as configuration file.'

Read Configuration Data from Device

You can read the configuration parameters from the VBrick by clicking the **Read** button on the page. After clicking on the button, an xml document with all the configuration parameters will pop up (see Figure 4). The .xml document can then be saved to your PC as an .xml file using **File > Save As**. To view this file offline, you must download the style sheet (see **click here** on the screen) to the same directory as the saved file. Do not change the name of the style sheet. It should always be saved as `cfgdata.xml` and the first line at the top of the configuration file must always be: `<?xml-stylesheet type="text/xsl" href="cfgdata.xml"?>`

Note Firefox users: To view and/or save the configuration file, click **Read** and then **Save to Disk**. Then use **click here** and save the stylesheet to disk. This will copy both items to your desktop so you can view the configuration file using the stylesheet.

Figure 4. Sample VBrick Configuration File

Maintenance: Read/Write > Write To Device

This page lets you write configuration parameters from an .xml file to the VBrick. On a successful write, all parameters will be saved to Flash and the appliance will reboot. Only administrator level users and above have **Write** privileges.

Note The VBrick appliance that the configuration file is read *from*, and VBrick appliance that the configuration file is written *to* must be running the same version of code.

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The page title is "Maintenance: Read/Write Configuration". On the left, there is a "Maintenance" sidebar with a list of options: "Device Information", "Default All Configuration", "Read/Write Configuration", and "Change User Names & Passwords". Below the sidebar is a green "END EDIT" button. The main content area has a header "Maintenance: Read/Write Configuration" and a sub-header "Read From Device Write To Device". Below this is a section titled "Write Configuration Data To Device" which contains a "File:" label, a text input field, a "Browse..." button, and a "Write" button. A note at the bottom of the page states: "Note: This feature allows for full or partial configuration restoration, based upon a previously saved XML file. You should carefully review the file beforehand. You can [click here](#) to download style sheet for viewing configuration data you are going to write. Please do not rename the style sheet file (XSL), and save it to the same directory as configuration file. Please make sure the unit is not performing critical operations or under heavy usage before attempting to write the configuration."

Write Configuration Data to Device

- ▼ To write configuration parameters to the VBrick from an .xml file
 1. Click the **Browse** button and navigate to the configuration file you want to write to the appliance.
 2. Click on the **Write** button to write the selected file to the VBrick. The configuration parameters will be saved to Flash memory and the appliance will reboot. In the event of a validation error, a message will appear on the screen. Click on **Errors** to view error messages that might have caused the validation failure. The error list is not generated for all types of write configuration failures so you may need to locate the error(s) manually by clicking through the IWS pages in Edit mode and looking for error messages highlighted in red.
- ▼ To create a configuration file
 1. Read the configuration from the VBrick and save as an .xml file. See [Read Configuration Data from Device](#) above.
 2. Use any text editor, preferably an .xml editor to make changes to the file. You can change the "values" field as well as delete objects as necessary. Make sure the right data types are used. For example if a parameter takes integer values, do not enter a string. Also IP Address parameters must have the right IP syntax. Enter "0.0.0.0" to enter a null IP address. Blanks and null strings are not valid IP Addresses.

Maintenance: Change Usernames & Passwords

Maintenance: Usernames & Passwords > Change Usernames & Passwords

This page lets an Administrator change usernames and passwords for security purposes.

Maintenance: Usernames & Passwords > Change SNMPv3 Passwords

SNMPv3 provides additional security that exceeds that available with SNMPv2. SNMPv3 authentication provides the ability to validate the transaction between host and client and hides the traffic with secure (DES) encryption. It also provides a user-based security model rather than a community-based model. VBrick's implementation allows you to use both v1/v2 and v3. For the highest security, disable SNMP v1/v2 (see [Configuration: System > Security](#) on page 47).

Maintenance Mode

Topics in this chapter

Overview	95
Maintenance Mode CLI Operation	97

Overview

Maintenance Mode is automatically launched when the software on the VBrick does not boot. Maintenance Mode runs from a reduced functioning kernel that provides a limited CLI and IWS interface. The Maintenance Mode interfaces provide minimal configuration capabilities. Maintenance Mode can also be used as a means of downloading new firmware. *If your appliance enters maintenance mode during or after a firmware download you can simply rerun the download and reset the appliance to return to normal run mode.* Maintenance Mode is an operational mode that in which a VBrick runs with a reduced subset of code. It normally happens only when a power failure occurs during a software download. It provides limited capacity of the IWS interface to manage some parameters of the VBrick appliance. Note that security is maintained in Maintenance Mode, so the user must be at administrator level to change the parameters.

Maintenance Mode (admin)

Reason: Application failed to startup and give OK

Configuration: Network

Ethernet

Network DHCP Disabled Enabled

IP Address

Subnet Mask

Gateway IP

Host Name

APPLY

Box Information

Main Board Information

Part Number	9190-4200-1002
MAC Address	00:07:df:01:51:03

DHCP Enable/Disable	If DHCP is enabled the VBrick must get it's IP address and Subnet Mask from the DHCP server. If the DHCP server supplies the Gateway address or DNS server address, these parameters will replace user-entered parameters.
IP Address	IP address associated with the Ethernet interface of the VBrick.
Subnet Mask	Subnet mask for the VBrick Ethernet IP address.
Gateway IP Address	Gateway IP address for communicating across the Ethernet segment attached to the VBrick.
Host Name	On Ethernet models, this is used for DHCP Client Host Name. The Host Name defaults to the Media Access Control address, a hardware address that uniquely identifies each node of a network. Host Name can be 18 characters maximum and the first character must be a letter. The remaining characters can be letters, numbers or hyphens.

Maintenance Mode Features

- Provides support for the download and upgrade of software via VBDownload.
- Supports limited IWS and CLI for configuration and diagnosis.
- Local access of the VBrick is supported through COM 2 on the rear of the box, refer to the section on Command Line Interface (CLI) in Chapter 10 for details.
- Remote configuration is supported over Ethernet. In addition, Maintenance mode will configure these interfaces according to the parameters specified in Full Feature Mode.
- Previously configured Usernames and Passwords are remembered in Maintenance Mode.
- Maintenance Mode contains the ability to change the IP parameters for the Ethernet port.
- Maintenance Mode contains the ability to set the configuration parameters to defaults.
- Maintenance Mode contains the ability to reboot the VBrick.

Maintenance Mode Limitations

- Neither video nor audio can be sent or received while in Maintenance Mode.
- Only the Ethernet IP parameters can be changed while in Maintenance Mode.
- SNMP is not supported.
- Unlike IWS and CLI operations in Full Feature Mode, Maintenance Mode IWS and CLI do not automatically save and reboot when the network parameters are changed. In Maintenance Mode, after the user initiates changes and then applies them, it is necessary to manually save and reboot the appliance. Command Line Interface (CLI) in Maintenance Mode does not support the Global Editing Commands: be, en and sh.

Maintenance Mode Indicators

There are three indicators that show when you are in Maintenance Mode:

- If you enter Maintenance Mode, the front panel display (LCD screen) will read "Maintenance Mode xx", on the top line and the IP Address in the second line, "xx" indicating the reason for being in Maintenance Mode.
- If you log into the Integrated Web Server (IWS), the screen indicates the appliance is in maintenance mode and the reason.

- The Telnet and/or Command Line Interface (CLI) prompt after you login is `VBMainMode>` and displays one of the following codes.

Code 10	Operating system failed to load or the flash is corrupted.
Code 20	Critical system files are missing or corrupted.
Code 30	The Hardware Watchdog has failed.
Code 50	Invalid Flash parameters found, defaults used.
Code 60	Corrupted Bootline, default used.
Code FF	Application failed to start up successfully either because of the configuration or another problem. The VBrick appliance will enter Maintenance Mode if the appliance does not boot properly on four consecutive attempts.

Maintenance Mode CLI Operation

After logging into Maintenance Mode as the Administrator, the `VBMainMode>` prompt is displayed and one or more of the following command sequences can be issued from the Command Line Interface. By design, in Maintenance Mode, after the user initiates changes and applies, it is necessary to manually save and reboot. For more about the Command Line Interface, see the *Network Appliance Installation Guide*.

▼ To use CLI commands in Maintenance Mode

- Make all desired changes, in any sequence, using the commands in Table 6.
- When done type `cnt a` to apply the changes.
- Type `sv` to save the configuration.

Table 6. CLI Commands

Command	Description	Entry
<code>e 2</code>	To start the editor mode. This command must be entered prior to any other command.	Type <code>e 1</code> to display editor status.
<code>ex</code> or <code>exit</code>	To leave the current menu level and move up through the menu system.	
<code>rb</code>	Reset the VBrick	Enter <code>y</code> (yes to reset).
<code>sd</code>	Set the configuration parameters to factory defaults, except the Ethernet IP parameters	Confirmation is requested.
<code>sfd</code>	Set the configuration parameters to factory defaults, including the Ethernet IP parameters	Confirmation is requested.
<code>cnt 5 x</code>	To enable or disable DHCP	1 – Disable DHCP 2 – Enable DHCP

Command	Description	Entry
<code>c nt 6 xxx</code>	To edit the IP Host Name. The default is the Media Access Control (MAC) address, a hardware address that uniquely identifies each node of a network.	The Host Name can be a maximum of 18 characters; the first character must be a letter and the last character a number. The middle characters can be letters, numbers or hyphens.
<code>c nt 2 yy.yy.yy.y y</code>	To edit the IP address	Where yy.yy.yy.yy is the new IP address.
<code>c nt 3 zz.zz.zz.z z</code>	To edit the Sub Net Mask	Where zz.zz.zz.zz is the new subnet mask associated with the Ethernet interface.
<code>c nt 4 vv.vv.vv.v v</code>	To edit the IP Gateway address	Where vv.vv.vv.vv is the IP address of the IP gateway.
<code>c nt 1</code>	Displays the IP parameters	
<code>s ui m 1</code>	Displays Board User Information.	The User Information contains the part number and Ethernet MAC address of the VBrick.
<code>c nt a</code>	Apply the changes	Must be issued prior to save.
<code>sv</code>	To save the configuration	Enter y (yes to save).

VBStar Record.....	105
VBStar FTP File Transfer.....	111
VBStar Status.....	114

Introduction

A VBStar is an MPEG-2 appliance with a hard drive; an industry-first MPEG-2 video compression and transport appliance. Capacity depends on the video bit rate. For example, a 60 GB internal drive easily holds more than 24 hours at the bit rate of 5.5 Mbps and below and hard drives continue to get larger. Refer to the specifications for your current hard drive.

Through its "store-and-forward" mechanism, VBStar transports DVD-quality video over wide-area networks. It extends existing video capabilities in education, government, surveillance and transportation. With VBStar, educational lectures, corporate messages, sales training and technical information can be encoded and recorded and the video sent – all in one step – for on-demand viewing from any location, on site or off. Live camera video can be recorded to disk and transferred to another VBrick over the Internet to a remote monitoring location for near real-time viewing.

A simple remote control command enables users to record video from any source, save MPEG-2 video to an internal disk, and send it to a VBrick appliance anywhere in the world over an IP network. VBStar also has Serial Digital interface capability for those in the broadcast arena. The video can be viewed on any TV or computer monitor. VBStar includes advanced features that allow users to record one stream while viewing another. Available with both an encoder and a decoder, VBStar includes a hard drive for internal storage and on-screen recording and playback guides, all managed through the IR remote control. An on-

screen icon indicates when a recording is in progress. VBStar combines digital television recording, networking and video storage with an MPEG-2 video server in one compact package. VBStar provides efficient, robust and feature-rich MPEG video storage and playback capabilities. Through its record and FTP capability, VBStar eliminates the reliance on broadband networks, including Quality of Service requirements. A VBStar encoder allows recording and playing audio and high quality 30-frame per second MPEG video streams on desktop PC's and Television monitors located anywhere in the world.

Recording vs. Archiving

MPEG-2 encoders behave differently when mixed models are present in the same enclosure. For example when there is a WM encoder in Slot1 and an MPEG-2 encoder in Slot2, the MPEG-2 recorder becomes an archiver and *not* a recorder. (An archiver can only record from an associated encoder whereas a recorder can record from an encoder, a decoder, or from the network.) This section explains in detail how the MPEG-2 encoder works when functioning as a recorder (see [VBStar Record](#) on page 105). For an explanation of how the MPEG-2 encoder works when functioning as an archiver, see "Configuration: Encoder > Archiver" in the *WM Appliance Admin Guide*.

Note In mixed models with an MPEG-2 encoder in Slot1 and an MPEG-4 encoder in Slot2, you can only record from the MPEG-2 encoder.

VBStar Pump

MPEG-2 video can be played directly from the internal hard disk or streamed from the VBrick to an unlimited number of desktops over an Ethernet/IP. The term "Pump" is used in connection with VBStar screens to indicate that video stored on the hard drive may be transmitted similar to the way VBrick delivers live video. Any file selected using any of the management interfaces can be sent to any address on the network. To view the file locally, it is necessary to specify the file and enter an appropriate multicast or unicast address into the pump destination address field. A file may be pumped in batch mode or single file mode. The designated file or batch may be pumped once or continuously. The file may also be pumped automatically as soon as it is received through FTP.

Configuration: Pump > General

Click here to examine ...	Click on this link to examine hard drive content. You must know the user name and password to login to the FTP server and view content. You can use any FTP client application to access the hard drive using a URL like this: ftp://admin@<IP_Address>/D: Be sure to login to the D: drive as shown. Do not modify or store files on the C: drive. <i>The C: drive has limited space and is reserved for VBrick firmware.</i>
Pump Mode	Used to set the stream to be controlled manually or to automatically start at the VBStar Power-Up.
Pump File Name	This is the file that will "Pump". In batch mode, the Batch Base File Name is usually entered as the Pump File Name, the batch files will be played from the lowest numbered through the highest number. If a batch file name is entered with a particular batch file number, the file will be pumped using that file as the starting point. Any missing files in the series will be skipped and the next sequential file will play. Example: If files test1.mpg through test15.mpg exist and the user specifies test5.mpg, test5.mpg through test15.mpg will be played. After playing test15.mpg, test5.mpg will be played again, even though lower numbers of the file exist.
IR Enable	Is used to enable or disable the use of IR Controller to "Pump" the specified stream.
Batch Enable	If enabled, a series of files in a batch will be played sequentially. If disabled, only a single file will be played.

Continuous Enable	If Once is selected the selected file or batch will play through to completion and stop. If Continuous Repump is selected, the selected file or batch sequence will be continuously played until the stop button is pressed or a different file is selected. When the file or batch has completed playing it wraps to the beginning and plays again.
Auto Pump New File	Can be enabled or disabled to allow any file to be automatically pumped on FTP reception. If batch mode is enabled, any file with the identified base name will be pumped on FTP reception. If batch mode is not enabled, any file FTP'd to the disk will be pumped on reception. Some special cases of operation following an FTP onto the hard drive. <ul style="list-style-type: none"> • If both Batch Mode is enabled and Continuous Enable is Continuous Repump, the FTP'd file that belongs to the series is played when its turn is reached. If it is not part of the series, it is not played. • If Batch Mode is enabled and Continuous Enable is Once, all files will be played. If the FTP'd file belongs to the series and has a greater index than the last file played, then the FTP'd file is played. Otherwise nothing happens. • If Batch Mode is disabled and Continuous Enable is Continuous Repump. The current file completes, and the new file is played continuously. • If Batch Mode is disabled and Continuous Enable is Once. The current file will be completed and the FTP'd file will start.
Pump State	Is a read only field that lets you know if the Pump is running or stopped.

Using Mixed Models

MPEG-2 encoders behave differently when mixed models are present in the same enclosure. For example when there is a WM encoder in Slot1 and an MPEG-2 encoder in Slot2, the MPEG-2 recorder becomes an archiver and *not* a recorder. This section explains in detail how the MPEG-2 encoder works when functioning as a recorder. For an explanation of how the MPEG-2 encoder works when functioning as an archiver, see "Configuration: Encoder > Archiver" in the [WM Appliance Admin Guide](#). In mixed models with an MPEG-2 encoder in Slot1 and an MPEG-4 encoder in Slot2, you can only record from the MPEG-2 encoder.

Filename Syntax Rules

Hard drive features are designed to support a root directory and one level of subdirectory when the hard drive is used for VBStar functions, such as Record, Pump, Playback, and Automatic and Manual FTP. Filenames for Recording are set on the Configuration: Recorder > General page in IWS. The syntax for a file name, including the directory name, is limited to 56 characters, consisting of a combination of the directory name, the file name and the backslash. For example: `d:\directoryname\filename.ext`. The following syntax rules apply.

- One sub-directory level is allowed.
- 56 total characters are allowed, including up to 25 in the directory name and up to 25 in the file name.
- Only 25 characters are allowed in the directory name. Note: \ " : * ? > < | [] are invalid characters.
- Only 25 characters are allowed in the file name (of which 23 can be entered by a user). The last two characters are reserved for an index number from 1-999 to support the option of batch mode. The restriction on the root filename exists even if batch mode is not enabled to allow a switch to batch mode without requiring a change to the filename.
- The extension (.ext) has a maximum three characters, only alphanumeric. The default extension is .mpg. The allowable extensions are .mpg, .m2g, .m2t and .m2v.

Recording Batch Files

Batch mode records video in pieces. It allows a VBrick to transfer segments of a conference, event, training session, or any video, to a remote VBrick, while continuing to record. Batch processing minimizes the delay inherent with store-and-forward video, providing MPEG-2 video in near-real time. Batch file names are created in the Recorder: General section of IWS. A batch file is one of a group of files that are handled as a single entity. The **Recorder File Name** is the base file name of the batch, for instance filename.mpg. Three digits are reserved at the end of the base file name to signify the index number of the batch file. Index numbers are assigned to the base file name from 1–999 as files are recorded (filename1.mpg through filenamexxx.mpg).

When VBStar creates a file for batch record, two files are created; the first is the file currently being recorded, and the second is the next index file, readied to receive data. Video is recorded into a batch file until the batch duration time is reached, or 4 GB, whichever comes first. When the first file is full, the new file becomes the target of the record operation. In batch mode, if the batch base file name is used as the **Recorder File Name**, the first file recorded will be numbered one greater than the most recent file recorded. For instance, if test.mpg is selected as the **Recorder File Name**, the batch file numbering will start at

test1.mpg; if test1.mpg, test2.mpg and test3.mpg exist, and the Recorder File Name is still set at test.mpg, the new recording will start at test4.mpg. If the Recorder File Name is set at to particular index number, such as test2.mpg, the first file to be recorded will be test2.mpg and the batch recording will increment from that number.

Note The maximum batch file size is 4 GB. If an attempt is made to record files using the maximum file size (4 GB) in the maximum number of batch files (999), the files can exceed the hard disk drive storage capacity. If the files are large, it might be best to set a Batch Wrap Point.

Batch Wrap Point and Record Duration

A **Batch Wrap Point** sets the number of files to be recorded. When the specified number of files has been created, the previously recorded batch files will be deleted and recorded over, starting from the earliest file. For example, if a Batch Wrap Point is set to 10, and test.mpg is the Recorder File Name, the files will be recorded from test1.mpg, test2.mpg, up to test10.mpg.

Batch File Recording can be set to a specific number of seconds or Continuous. If Batch is enabled and set to Continuous, when the maximum number of batch files is reached, recording will record over the files previously recorded, starting from the first file. As one file is being recorded, the next index file is deleted to get ready to receive data (from 1 to 999). For example, if the wrap point is set to 10 and a batch file name is specified as test5.mpg, the files will be recorded (or recorded over) starting at test5.mpg and increment until test10.mpg is reached. When the number of files reaches the **Batch Wrap Point** of 10, the files will be recorded over starting with test1.mpg.

Note If VBStar encounters an interruption in file transfer during batch recording, the file being recorded and the next file will both be affected. The file in the process of being replaced will be partially recorded. The next sequential file that was deleted to get ready for receiving data will be missing.

Configuration: Recorder > General

<p>Click here to examine ...</p>	<p>Opens an Internet Explorer FTP session window. See Configuration: Recorder > Operation on page 110 for more information.</p>
<p>Recorder Mode</p>	<ul style="list-style-type: none"> • User Controlled – The user controls when to record files via any of the following methods: IWS, CLI, IR Remote, SDK, or SNMP. • Start Record on Power-up – When the appliance is powered up the files will begin being transferred. • Recorder Schedule – Files will be recorded at a scheduled time.
<p>IR Enable</p>	<p>Enables or disables only the Record and Send buttons on the Infrared handheld remote control device. The master enable/disable for all functions is in Configuration: System > General.</p>
<p>Recorder File Name</p>	<p>The root name of the file to be recorded. The VBStar recorder can automatically use current date, current time, and/or host name when it creates a new file. Use this feature by configuring the filename to contain any of the following strings in any order.</p> <ul style="list-style-type: none"> • >h or >H – Host Name. • >d or >D – Current Date. • >t or >T – Current Time.

Recorder Source	<p>Defines the source of video for record. When Dedicated is selected as the Recorder source, the Network option screen appears as a selection. The Network selections allow the user to set parameters necessary to record video from a particular Receive IP address and Port. If a slot is selected as the Recorder Source, the Network screen does not appear and whatever video is being received by the designated decoder is recorded.</p> <ul style="list-style-type: none"> • Dedicated – Indicates that the settings are read from the VBStar settings on the Configuration: Recorder > Network page is IWS. • Decoder Slot # – Indicates that the settings are set for a specific Decoder Network Configuration. When a Slot # is specified, the Network option does not appear since it has no affect.
Recorder Schedule	Specify the begin date and time for the archive in <code>mm/dd/yyyy hh:mm</code> format (with <code>hh:mm</code> in 24-hour format).
Record Duration	The length in seconds of the entire recording session, or Continuous.
Batch Enable	Disabled or Enabled. If enabled, the recorder will create a series of files and the files will be numbered incrementally.
Batch Duration	The length of each batch file in seconds or Maximum. The minimum length is 30 seconds.
Batch Wrap Point	Sets the number of batch files (1–999) that will be recorded before "wrapping over" the previously recorded files (from lowest to highest batch number).
Auto FTP after Record	Disabled or Enabled. If enabled, the file is automatically FTPed when the recorded file is completed.
New File on Channel Change	Determines whether or not the Hard Drive starts a new file upon channel change while recording.
OSD Recorder Indicators	Selecting will show indicators that will appear on the attached TV screen indicating a record session is in progress. This is a decoder function.

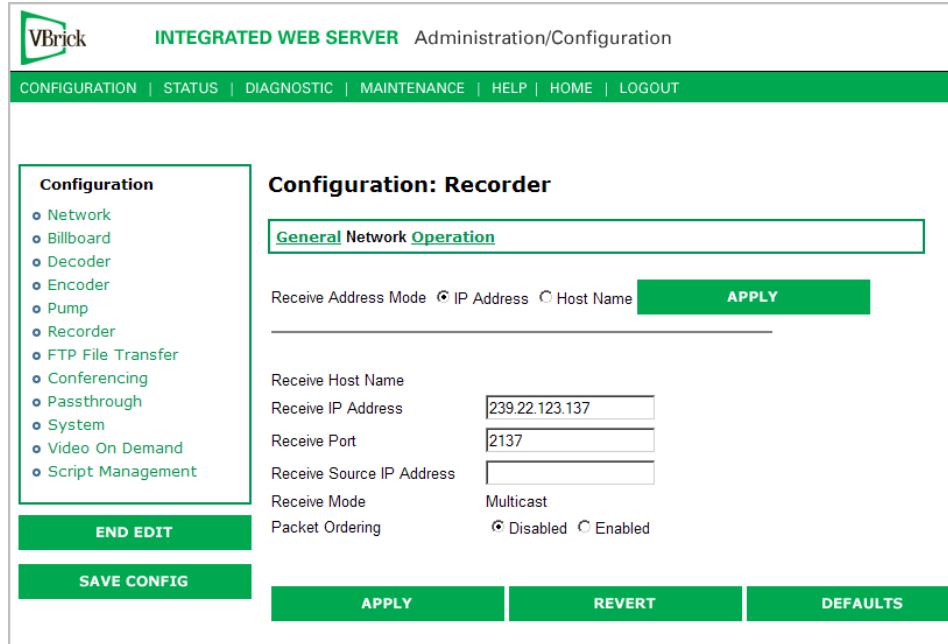

FTP Server Enable

1 to 8 servers are available for FTP. The parameters for these servers are set in the Configuration: FTP File Transfer > Server menu screen of IWS. When more than one server is enabled, the appliance will transfer the newly recorded file to each of the enabled servers, up to a maximum of eight.

Since FTP transfer can be a slower process than the recording process, it is possible to overrun the FTP queue, especially if many servers are enabled. Also, if operating in Batch record mode and the recorder attempts to open a new file that has not been completely transferred, the recorder will stop. The Failure condition is noted in the Recorder Status menu.

Configuration: Recorder > Network

The Network configuration tab is only displayed if you select **Dedicated** for **Recorder Source** on the previous Configuration: Recorder > General page.

Receive Address Mode	Allows the user to specify how the receive address will be configured: IP address or Host Name.
Receive Host Name	The source for video to be received by using Host Name of the source. This parameter can be used only for a unicast source.
Receive IP Address	In multicast mode, this parameter selects the receive IP Address for the Recorder. In unicast mode, this parameter is optional. If left blank, the Recorder will accept all data received on the receive IP port. If set, the Recorder will communicate with any VBrick having the encoder "unicast poll" option set and instruct it not to transmit its stream unless the encoding VBrick has the selected receive IP Address.
Receive Port	The receive port designates what local IP port is assigned to listen for incoming video.
Receive Source IP Address	See Source-Specific Multicast on page 20. If multiple streams are using the same IP address and port, the appliance will only listen for multicast from this IP address.
Receive Mode	This read-only parameter informs the operator whether the selected receive IP Address is Unicast or Multicast.
Packet Ordering	Toggles the state IP packet ordering. The identification number in the IP header determines IP packet ordering. Out of order packets are discarded prior to being given to the decoder. Generally, when packet ordering is enabled, the VBrick will store the out of order packets and attempt to reassemble the entire datagram. Some sources of video may not utilize the identification number field in a consistent manner and therefore the packet ordering feature may need to be disabled.

Configuration: Recorder > Operation

The screenshot shows the VBrick Integrated Web Server Administration/Configuration interface. The top navigation bar includes links for CONFIGURATION, STATUS, DIAGNOSTIC, MAINTENANCE, HELP, HOME, and LOGOUT. The main content area is titled "Configuration: Recorder" and is divided into a left sidebar and a main panel. The sidebar lists various configuration categories, with "Recorder" selected. The main panel displays the "General Network Operation" section, which includes a link to "Click here to examine hard drive content" and a table of recorder status and settings. A "REFRESH" button is located to the right of the table. At the bottom of the main panel, there are "Start Recorder" and "Stop Recorder" buttons.

Configuration: Recorder	
General Network Operation	
Click here to examine hard drive content	
Recorder State	Stopped, Never Started
Recorder Mode	User Controlled
Receive IP Address	239.22.123.137
Recorder File Name	max.mpg
File Start Time	
Data Recorded (Bytes)	0
File In Progress	--none--
Last Complete File	--none--
FTP Status	Idle
FTP File In Progress	--none--
Last Completed FTP File	

Click here to examine ...	This link opens an Internet Explorer FTP session window. The link to view the hard drive content from the Integrated Web Server spawns an additional Internet Explorer window. After logging out of the IWS, it is a good idea to close all Internet Explorer windows and exit Internet Explorer. Note that it is not possible to view the VBrick's hard disk when running Microsoft Internet Explorer on Windows NT. Due to a limitation in Windows NT, Internet Explorer FTP is not invoked.
Recorder State	Displays the state of the recorder. Values can be Failed Stopped, never started Stopped, by user Stopped, Disk Full (less than 100 MB remains) Stopped, File Size Limit (approximately 4 GB) Stopped, FTP Overrun Stopped, Duration Complete Stopped, Unformatted Stopped, IO Error Stopped, File Is Pumping Running, From Power Up Running, Scheduled Running, User Initiated

Recorder Mode	Reports the Recorder mode, User Controlled, Start Record on Power-up, or Scheduled.
User Controlled	The user controls which files to record and send to which configured server.
Start Record on Power-up	When the appliance is powered up, the recorder will automatically start.
Scheduled	The files will start recording at the scheduled time.
Receive IP Address	The address of the video source. If unicast, this is the same as the sender's source IP address.
Recorder File Name	File name to be recorded.
File Start Time	Starting time of the recording.
Data Recorded	Reports the number of bytes currently recorded.
File in Progress	Name of the file currently being recorded.
FTP Status	The status of the Hard Drive FTP send. Values can be: Transfer in Progress Idle Invalid FTP Server Invalid User Name Invalid User Password Local File Open Error Socket Open Failure Transfer Failure Socket Quit Failure
File in Progress	Name of the file currently being sent to the FTP destination server(s). <ul style="list-style-type: none"> • Last Complete FTP File – Name of the last completed file sent via FTP. • Operation Functions Buttons: • Start Recorder – Starts recording selected file (s) to the Hard Drive destination. • Stop Recorder – Stops recording selected file (s). • FTP Auto Send – FTP last recorded file via enabled servers. • Refresh – Refreshes the content of this screen.
Last Completed File	The name of the last completed file. In a batch file, this is the last indexed file completed.

VBStar FTP File Transfer

Configuration: FTP File Transfer > Servers

Up to eight servers are available and can be simultaneously selected. When more than one server is enabled, the appliance will transfer the newly recorded file to each of the enabled servers, up to a maximum of eight. Since FTP transfer can be a slower than the recording

process, it is possible to overrun the FTP queue, especially if many servers are enabled. Also, if operating in Batch record mode and the recorder attempts to open a new file that has not been completely transferred, the recorder will stop. The failure condition is noted in the Recorder Status menu.

FTP Server 1–8

Name	Ftpserver1 through Ftpserver8.
Type	<p>VBrick or Non-VBrick Appliance.</p> <ul style="list-style-type: none"> VBrick Appliance – When sending to a VBrick appliance, the serving VBrick must select the D: directory. The configuration of VBrick Appliance automatically adds D: to the path name or to any other configured folder or as part of the Directory entry. If no folder is specified, all files will be transferred to the D: directory. Additionally, subfolders may be specified. Non-VBrick Appliance – A non-VBrick appliance setting allows a destination server to select its own path name, based on account user name and password. In this case, the Directory setting may be used to specify any sub-folder on the server.
DNS Name/IP	The DNS server name or IP address for the FTP server. It accepts up to 20 characters. The Host Name/IP must be a DNS Host Name.
User Name	The FTP server user's account name.
Password	The password required to access the FTP server. Optional entry. Accepts up to 20 characters. The FTP User Name and Password must be set up properly on the remote FTP server. If they are not entered the same as what is set up on the server, the VBrick will be unable to connect and perform the transfer.

Account	The account name required to access the FTP server. Optional entry.
Directory	This object allows a manager to switch to a different directory within the FTP server after login. Optional entry. Accepts up to 64 characters. Anonymous FTP is not supported.

Configuration: FTP File Transfer > Transfers

You can separately setup and use eight servers for FTP File Transfer. Enter the server parameters in the **Configuration: FTP File Transfer > Servers** screen of IWS.

The screenshot shows the 'Configuration: FTP File Transfer' interface. On the left is a sidebar with a 'Configuration' menu containing items like Network, Billboard, Decoder, Encoder, Pump, Recorder, FTP File Transfer, Conferencing, Passthrough, System, Video On Demand, and Script Management. Below the sidebar are 'END EDIT' and 'SAVE CONFIG' buttons. The main area is titled 'Configuration: FTP File Transfer' and contains a 'Servers Transfers' section with a link to examine hard drive content. Below that is the 'FTP Status' section showing 'Current File: --none--', 'Size: 0', 'Rate: 0', 'State: Idle', and 'Transferred: 0'. A 'Last Queue Operation:' field is present with a 'REFRESH' button. The 'FTP Queue Operation' section includes a 'Directory' dropdown (D:\), a 'File' dropdown (---- Select a File ----), a 'Batch' dropdown (Not a Batch), and a 'Destination' section with checkboxes for eight servers (FtpServer1 through FtpServer8), where 'Server 3: FtpServer3' is selected. At the bottom are 'Add To FTP Queue', 'Remove From FTP Queue', and 'Flush Queue' buttons. The 'Current Queue Content (Server::File)' section shows a header '---- Select a File From the Queue ----' and an empty list area.

FTP Status

Current File	The filename of the current file being FTPed.
Destination	FTP server name from server configuration page.

State	The current state of the Hard Drive. Values can be: <ul style="list-style-type: none"> • Transfer in Progress • Idle • Invalid FTP Server • Invalid User Name • Invalid User Password • Local File Open Error • Socket Open Failure • Transfer Failure • Socket Quit Failure
Size	Size of the file to be sent.
Rate	Transmitted data rate of the file being FTPed.
Transfer	Current amount transferred.
Last Queue Operation	File added OK; or File removed OK; or blank.

FTP Queue Operation

Changes to the entries on the screen do not take effect until you select an action button (**Add to FTP Queue**, **Remove from FTP Queue** or **Flush Queue**).

Directory	The target directory located on the server. See notes under sending to VBrick and non-VBrick appliances in the previous IWS screen.
File	Name of the File from the hard drive.
Batch	The batch filename of an individually indexed batch file. If a whole batch is to be FTPed, File should be set to the base name of that batch and this object is to be set to Entire Batch.
Destination	The server to which the file or files is to be transferred. Servers are configured in the Servers section of the same page.
Add to FTP Queue	Adds the selected file or the batch of files, as indicated by to the FTP file and Batch drop-down box. FTP transfer starts immediately after operation.
Remove from FTP Queue	Allow the file to be removed from the FTP transfer queue.
Flush Queue	Removes all the current files from FTP transfer queue. It also makes any changes made to the variables of this group operational before performing this flush action, so that the values of variables in this group represent the actual values used by the VBrick.

VBStar Status

For a description of VBStar Status screens, see [Status: Hard Drive Status](#) on page 70.
